# NUMATICS®

The Micro-Filtration brand is a product of Numatics, Inc., a leading manufacturer of pneumatic products and motion control products. Our broad spectrum of standard, custom developed products and application components, have made a significant impact on pneumatic innovation as well as pneumatic and motion control technology. Our company has an extensive history of generating innovative concepts and technological breakthroughs. Many of today's standard features in pneumatic technology were industry firsts from Numatics. We continue our innovative approach to product development by developing electric motion control solutions and enhancing our embedded Fieldbus and I/O products to continually meet and solve our customer's application requirements.

Today Numatics is proud to be a part of the Industrial Automation Division of Emerson Electric Co.

Emerson (NYSE: EMR) is a global company that brings together technology and engineering to provide innovative solutions for customers in a wide range of industrial, commercial, and consumer markets.

Numatics, along with the vast resources of the Emerson organization, will assure that our proud history of innovation and service will continue to meet the needs of our global customers.

## Advanced Media Structure

### MicroPath™ Coalescing-Separator

Most coalescing-separators on the market today use multilayered or mechanically wound media - a design which causes particles to plug the outer layers - shortening the service life and change-out intervals.

That's why we've developed MicroPath™ - a proprietary weave of inorganic microfibers of different diameters. MicroPath™ media is vacuum formed into individual elements, creating millions of complex, tortuous paths of varying density. This design allows particles to be trapped through the entire cross section of the filter, lowering pressure drop and maximizing capacity.

MicroPath™ media is ideally suited for air to fluid separation and hydrocarbon or submicron particle removal. It offers a wide temperature range and compatibility with most fluids and contaminants.

MicroPath™ media is ideally suited for air-to-fluid separation and hydrocarbon or submicron particle removal.

Applications include water-oil separation, solvent recovery, air-oil separation, bacteria-dust removal, and removal of submicron particles.

### MicroPleat™ Particle Media

The life of any media is a function of the amount of solid contaminant subjected to the filter matrix - as the pores become blocked, the pressure drop increases and flow decreases. That's why we've developed MicroPleat™ media. It offers corrugated pleats which significantly increase surface area and are heated to prevent fiber shedding.

Numatics MicroPleat™ brand has resin-impregnated media to provide high performance particle removal in applications ranging from food processing to industrial filtration. It is manufactured from special grades of borosilicate glass, cellulose, and synthetically based fibers. MicroPleat™ media can be used in liquid and gas applications.

MicroPleat™ media features resin impregnated media to provide high performance particle removal in applications ranging from food processing to industrial uses.

Applications include blower intakes, liquid filtration, and clarification processes.

Visit [www.numatics.com/filterelements](http://www.numatics.com/filterelements) for a complete listing of products and more information on coalescing and particle media.

## The science of coalescing filtration

Air flows from the inside to the outside of the element through progressively larger openings in the media. As contamination moves through the element, solid particles are trapped and liquids are formed into large droplets. As the air exits the element, surface tension holds the liquids and allows them to drain to the bottom.

The MicroPath™ 0.3 micron borosilicate glass fiber element, when magnified 228x (left), shows deep, tortuous paths and large air pockets which provide high performance contaminate removal and longer life.

Contamination removal from a typical compressed air line with 0.3 micron MicroPath™ media is shown magnified 40x (right). The contamination contains hydrocarbon (black), oil (opaque drops), and metal fragments (shiny spots).

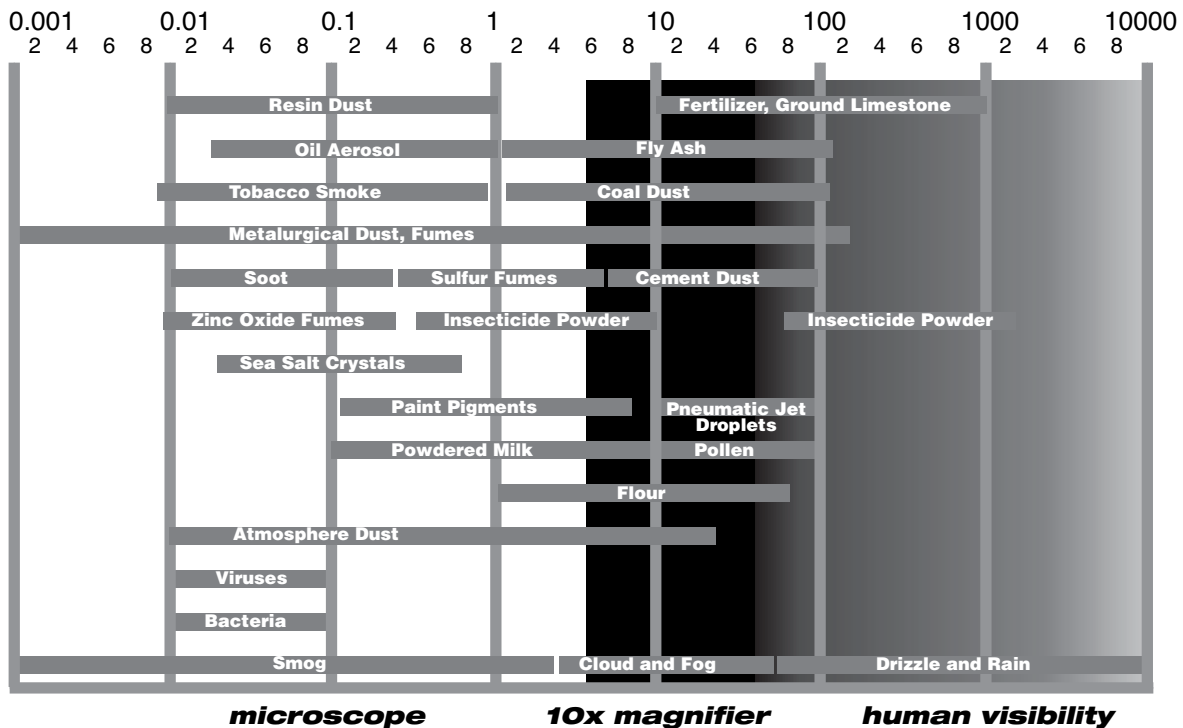

Scanning electron micrograph (at 228x)

Dirty filter magnification (at 40x)

With Numatics® elements like the one on the left installed in your system, the contamination on the right won't get to where it can cause damage. Your system lasts longer and costs less.

## What you get is not always what you see
