Custom Design

The Morse line of clutches covers a wide range of sizes and capacities, which handle the majority of industrial applications. However, there are applications that require special designs to meet specific application needs.

Emerson Power Transmission offers engineering assistance in both design and application to help meet these specialized requirements.

For selection assistance, call Application Engineering at 1-800-626-2093 or fax the completed form on page 76 to:

Emerson Power Transmission Application Engineering

Morse mechanical cam clutches are precision devices that lock the inner and outer races through the wedging action of cams to transmit torque in one direction of rotation while overrunning in the opposite direction of rotation. These type units are often referred to as freewheels, sprag, overrunning, backstop or one-way clutches, depending upon their application.

Clutches are available with a bore range up through 17.7" and a torque range up through 500,000 lb. ft. and are the most complete and versatile cam clutches available for a variety of applications – from small business machines to giant steel slitters.

Eleven series of clutches perform three basic modes of operation:

- Overrunning
- Indexing
- Backstopping

These units have set standards of performance, offering:

- Higher overrunning speeds
- Greater torque capacities
- Longer service life

M Series Clutch

(Page 14)

Features

- Self-contained clutch designed for a wide variety of applications
- Cam cage assembly engineered for optimum performance and increased capacity
- Two ball bearings included to support radial load and concentricity between races
- Close tolerance outer diameter to mount sheave, gears, sprockets and torque arms
- Positive contact lip or felt seals provided for grease or oil lubrication
- Tapped holes machined on ends of outer race for mounting auxiliary components
- Metric bore and keyway available
- Mounting accessories available

Bore range 0.5" – 6.437"

Torque range 275 – 25,000 lb-ft.

MZEU Series

(Page 28)

Features

- Full complement of cams
- Two bearings incorporated for concentricity control
- Symmetric, building block components
- Close tolerance outer diameter to mount sheave, gears, sprockets and torque arms
- Tapped holes at both ends of races to mount accessories
- Flange, torque arms and covers available

Bore range 0.472" – 5.9"

Torque range 44 – 25,000 lb-ft.

Conveyor Backstop Clutches

(Page 33)

Features

- Self-contained clutches created for high torque applications where reverse rotation of a head-shaft must be prevented
- Manufactured with large diameter rollers to provide bearing, clutch support, and maintain concentricity between inner and outer races
- Torque arm available to help prevent reverse rotations, plus an external felt seal and internal lip seal for low maintenance
- Available with an external felt seal and internal lip seal for low maintenance
- Retaining plate option available to secure backstop to shaft

Bore range 2.25" – 17.7"

Torque range 6,500 - 500,000 lb-ft.

KK15 - KK40 Series

(Page 45)

Features

- Self-contained ball bearing and cam clutch
- Designed with same dimensions as standard metric light series ball bearing
- Press fit option for shaft and housing
- Available with keyed inner and outer races
- Furnished filled with grease to increase wear life
- Seal options available for contaminated environments

Bore range 0.59" – 1.57" (15mm - 40mm)

Torque range 21.4 – 190 lb-ft.

NSS Series

(Page 52)

Features

- Designed with the same overall dimensions of a metric 200 light series ball bearing
- Created with an inner race containing a keyseat and an outer race that press fits in housing
- Excellent for applications where space is a consideration

Bore range 0.32" – 2.36" (8mm - 50mm)

Torque range 4.94 – 480 lb-ft.

Value-Added Capabilities

- Special bores (splined, dual keyways, extended with setscrews)
- Special width
- Custom seal designs (viton, all rubber, etc)
- Special greases (low-temp, food grade, etc.)
- Dual cages for higher capacity in a wider but small OD package
- Gear or sprocket tooth cut into OD of clutch
- Special label needs such as inclusion of OEM part numbers
- Ability to kit products for final assembly
- Assembled to sprocket, coupling, etc.
- Custom engineering designs for OEMs

NFS Series

(Page 54)

Features

- Designed with the same overall dimensions as medium 300 series metric ball bearing
- Manufactured with an inner race containing a key-seat and an outer race containing key slots
- Furnished with protective oil

Bore range 0.47" – 3.15" (12mm - 80mm)

Torque range 13.27 – 2,900 lb-ft.

B Series Clutches

Features

- Rugged cam clutch designed for applications where space and weight are factors in clutch selection
- Full complement of cams held in the outer races
- Input shaft used as the inner race must be hardened and ground to size
- Interchangeable with competitors' products
- Bearing support and lubrication required
- Primarily used for backstop applications

B-200A Series

(Page 56)

Bore range 0.650" - 2.209"

Torque range 39 - 575 lb-ft.

B-500A Series

(Page 58)

Bore range 0.650" - 2.04"

Torque range 60 - 1,250 lb-ft.

PB3A - PB16A Series

(Page 60)

Features

- Self-contained clutch designed with a bronze bushing for bearing support
- Hub diameter used for mounting auxiliary components such as gears, pulleys and sprockets

Bore range 0.375" – 2.00"

Torque range 40 – 1,800 lb-ft.

HT Series

(Page 62)

Features

- Designed for use on the end of a shaft
- Created for applications requiring space restrictions
- Integral bearing to help maintain concentricity
- Factory drilled and tapped holes for mounting accessories

Bore range 0.425" – 2"

Torque range 42 – 440 lb-ft.

BR Series

(Page 64)

Features

- Lift-off cam design provides contact free operation between the cams and races for increased wear life
- Symmetrical design allows operation in either direction
- External bearing support must be provided for concentricity between housing and shaft

Bore range 0.8" – 9.4"

Torque range 282 – 45,750 lb-ft.

Morse cam clutches are precision devices that positively lock to transmit torque in one direction of rotation but overrun (freewheel) in the opposite direction of rotation. Eleven series of clutches are available, all using the same principles of operation. Since clutch applications encompass a variety of load and speed characteristics, Morse clutches are manufactured in a range of capacities and styles that are designed to provide the best functional characteristics in performing the three basic modes of operation.

I. General Overrunning

Clutches used in this type of application overrun at either the inner or outer race and are occasionally called upon to lock up and drive.

A typical application is a standby drive where an electric motor and a standby diesel engine are connected to a single driven fan shaft through one-way clutches. The fan can be driven by the motor or diesel engine. The diesel drive clutch overruns when the motor drives the fan. The motor clutch automatically overruns when the load is transferred to the diesel engine.

II. Indexing

In this mode of operation, reciprocating motion applied to the driving race of the clutch is transformed into unidirectional, intermittent motion at the driven race. For example, on a printing press application, the clutch is mounted to an inking roll and a pinion is mounted to the driving race of the clutch. A rack meshing with the pinion provides reciprocating motion to the driving race. The clutch drives in the forward stroke (index) and overruns on the return stroke accomplishing intermittent unidirectional motion of the inking roll.

III. Backstopping

In backstop (holdback) applications, the clutches are used to prevent reverse rotation of drive shafts, which could damage machinery and other expensive equipment. With the outer race of the clutch anchored to a stationary member, the inner race can overrun freely in one direction of rotation; reverse rotation is prevented by the automatic engagement of the clutch. Typical backstop applications occur in conveyor systems and gear reducers.

B-200A, B-500, PB-A, HT, CB, M, NSS, NFS, MZEU Series

Morse clutches utilize a full complement of cams, which are placed between concentric inner and outer races. A light spring helps keep the cams in contact with the races. Torque is transmitted from one race to the other by wedging action of the cams between the races.

Morse mechanical clutches provide engagement or disengagement with minimal backlash.

Figure 1 shows the cams in a position to allow the inner race to overrun counter-clockwise or the outer race to overrun in a clockwise direction.

Figure 2 shows the cams are fully loaded and loads can be transmitted through the cams from a clockwise rotation of the inner race or a counter-clockwise rotation of the outer race.

KK Series

The KK clutch consists of a standard metric ball bearing combined with cams. The clutch design is unique, incorporating an independent cam-cage assembly installed alongside the offset ball cage. The clutch has the same overall dimensions of the metric bearing. The clutches are entirely self-contained, and do not require additional bearing support.

The cam-cage assembly uses an energizing spring to help keep the entire complement of cams in light contact with the races to provide rapid engagement when torque transmission occurs. The wedging action of the full set of cams produces significant torque capability in a compact, economical package.

Figure 3 shows the cam-cage assembly in the KK clutch in a position to allow the inner race to overrun clockwise or the outer race to overrun in a counterclockwise direction.

Figure 4 shows the cam-cage assembly provides a full complement of cams to wedge against inner and outer races allowing torque transmission through the clutch.

Figure 1
(Overrunning)

Figure 2
(Driving)

Figure 3

Figure 4

BR Series

The cam of the BR Series clutch is designed to lift off and have no contact with the inner and outer race while overrunning. This is due to centrifugal force and is the reason this type of cam clutch is known as a lift off type. These cam clutches are suitable for “overrunning

- high speed inner race/low speed engaged outer race” or “backstopping-high speed inner race overrunning”. There are two types available, an open type installed directly onto a motor or inside a reducer, or a package type that is installed on the outside of the application.

Morse mechanical clutches are utilized in many applications such as:

- Aircraft arresting gear equipment
- Compressors
- Conveyors
- Cranes and hoists
- Dry cleaning machinery
- Duplicator equipment
- Food processing machinery
- Heat-treat furnaces

- Induction draft fans
- Multi-state conveyors
- Packaging machinery
- Printing machinery
- Pumps
- Punch presses and feeds
- Railroad crossing gates
- Shoe machinery

- Speed reducers
- Standby power units
- Textile looms
- Two-speed grinders
- Two-speed shiftovers
- Washing machines
- Wire winding machinery

General Overrunning

Backstopping

Indexing

Full Cam Complement

A full complement of cams provides the maximum number of load transmitting members per given diameter, resulting in greater torque capacity size-for-size than other clutches.

Cam Design

Precision formed cams made of high carbon steel provide extra long wear and fatigue life. M Series models utilize formed cams providing uniform distribution of load between mating surfaces, resulting in low contact pressure levels.

Cage Construction

M Series models 300A - 700A contain a heavy duty, machined or stamped cage assembly providing equal placement and accurate positioning of each cam. The MI Series offers a patented, low inertial indexing cage design for engagement and disengagement of the cams. A contracting, energizing spring helps keep the cams in constant contact with both races for quick cam reaction.

High Quality Components

The clutch races are made of high quality alloy steel with high surface hardness and core toughness. Precision ground races provide excellent concentricities and surface finish for accurate cam action.

M series models are equipped with precision ball bearings and polyacrylic lip type seals for long life and low maintenance.

Overrunning Performance

Oil lubricated M Series clutches contain an exclusive patented venting method to reduce oil pressure buildup and permit higher overrunning speeds.

Morse mechanical cam clutches are an ideal solution for overrunning, indexing or backstopping applications.

Part Number Explanation

MZEU Series

MZEU 60 E1 + E2

* Covers ordered separately. Example: MZEU60-E1 cover or MZEU60-E2 cover.

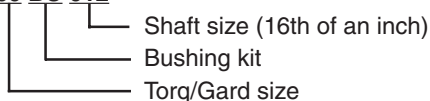

Torq/Gard

TGC 60

If required shaft bushing is ordered separately ex.

60 BU 012

Bushing kit includes key and set screws. Torq/Gards can be made into couplings by ordering separate components. Single strand TG sprocket kits to bolt on are stocked.

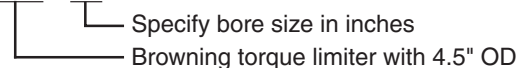

TG 40 A 45 K

Includes mounting bolts.

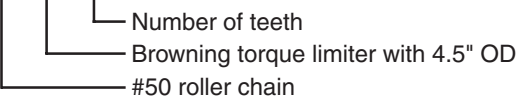

Browning Torque Limiter

T45L x FB

Bushing is supplied with Browning torque limiter. Sprocket for torque limiter is ordered separately 50T45L26.

50 T45L 26

Morse Torque Limiter

350A -2 TL x FB

Required bushing is ordered separately; bushing length determined by sprocket selection.

350 AG 5 26

Browning Torq/Pro

TP 30 H FB or MPB

When ordering a Torq/Pro coupling specify Torq/Pro unit, Torq/Pro sprocket, coupling chain and adjoining sprocket.

The M Series ball bearing clutches contain precision formed cams made from high quality steel that are hardened then precision finished. Our most versatile and custom configurable clutch, this unit is the workhorse of the industry. The unique finishing process provides a smooth cam surface resulting in uniform contact with the races, providing even load distribution and prolonged wear life. These clutch models are designed to mount on through shafts and are secured to the shaft by a matching key provided with each stock bore clutch. Grease lubrication for each series can be provided at no additional cost.

U. S. Patent Numbers 3,320,006, 3,542,442 and 4,130,191.

MG300A - 700A Series

Primarily used for general duty applications. Overrunning, back-stopping and light duty indexing. The MG model offers precise spring energizing to provide long overrunning wear life.

MI300A - 700A Series

Recommended for high performance indexing, used on applications greater than 150 strokes per minute or applications requiring high indexing accuracy. Incorporating a patented, low inertia cage and heavy duty energizing spring for quick cam reaction.

MO300A - 700A Series

Made with felt grease seals to minimize seal drag for high speed inner race overrunning applications. The MO model is delivered with standard grease lubrication.

MR300A - 700A Series

Intended for high-speed outer race overrunning, incorporating a unique cam cage construction that uses centrifugal force to minimize cam drag. The driving speed of the clutch cannot exceed the rpm shown in the table for the inner race.

¹ Stock bore sizes have hardened inner races and cannot be reworked. Non-stock bores can be furnished at an additional charge. To minimize critical stresses in keyway area of inner race, clutch keyways have radius in corners; a matching key is furnished with each stock bore clutch, except metric.

² Mounting holes are equally spaced on all models except model 700 which has six equally spaced mounting holes plus two additional positioned 30° from the equally spaced holes and 180° apart.

Features

- Self-contained clutch designed for high-speed applications
- Cam cage assembly engineered for optimum performance and increased capacity
- Two ball bearings included to support radial load and concentricity between races
- Positive contact lip or felt seals provided for grease or oil lubrication
- Tapped holes are machined on ends of outer race for mounting auxiliary components
- Metric bore and keyway available
- Mounting accessories available

Industries Served

- Corrugated
- Food and beverage
- Glass manufacturing
- Packaging
- Paper converting
- Printing
- Aggregate

Field Applications

- Amusement rides
- Auxiliary drives
- Conveyors
- Food processing
- Heat treat furnaces
- HVAC systems
- Packaging machinery
- Punch press machinery
- Start-up drives

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Models M750 - M1000

Models M750 – M1000 are ball bearing clutches. All models contain precision-formed cams and all clutch models are designed to mount on through shafts and are secured to the shaft.

Models MG750 - MG1000

Are designed with a cam cage specifically for inner race overrunning.

Models MR750 – MR1000

Are designed with a cam cage specifically for outer race overrunning.

Models MI750 – MI1000

MI models have stronger energizing springs for greatest response in indexing.

U. S. Patent Number 3,542,442.

¹ Stock bore sizes have hardened inner races and cannot be reworked. Non-stock bores can be furnished at an additional charge. To minimize critical stresses in keyway area of inner race, clutch keyways have radius in corners; a matching key is furnished with each stock bore clutch, except metric.

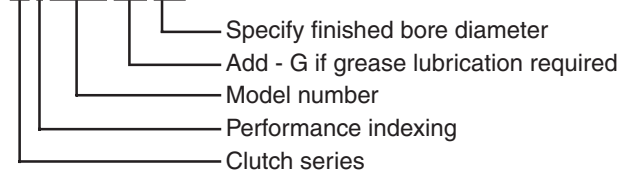

² Mounting holes are equally spaced on all models except model 750 which has six equally spaced mounting holes plus two additional positioned 30° from the equally spaced holes and 180° apart.

¹ Stock bore sizes have hardened inner races and cannot be reworked. Non-stock bores can be furnished at an additional charge. To minimize critical stresses in keyway area of inner race, clutch keyways have radius in corners; a matching key is furnished with each stock bore clutch, except metric.

² Mounting holes are equally spaced on all models except model 700 which has six equally spaced mounting holes plus two additional positioned 30° from the equally spaced holes and 180° apart.

Load-Cycle Performance Curves, Models MG & MI (300 - 700A)

The load life cycle curves in Figure 1 apply to clutches used in indexing applications. Using actual torque calculated from Step 4 on page 75, clutch selection can be made from Figure 1. Locate the point at which the horizontal torque line intersects clutch curve(s). At intersections, draw a line vertically downward to read life cycle expectancy in millions of load cycles. If the torque line intersects more than one clutch curve, select a clutch on the basis of desired life. Check to see that the selected clutch meets bore requirements.

Example: A clutch is required for indexing application on a low speed press. The actual torque = 100 lb. - ft. and bore requirement is 3/4 inches, the cyclic rate = 130 strokes/minute. From Figure 1, 100 lb. - ft. torque line intersects clutch curves MG300A and MG400A. Models MG300A and MG400A meet the torque and bore requirements of the application. Clutch selection to be based on desired cyclic life (MG300A, 10 million cycles; MG400A, 23 million cycles).

Figure 1. Load Life-Cycle for Morse MG Clutch Models

Clutch Wear Life Curves, Models MG (300 - 700A)

The wear life curves shown in Figure 2 apply to clutches used in overrunning or backstopping applications. Use inner race overrunning rpm and clutch size selected in steps 6 and 7 on page 75 to determine expected wear life.

Example: Assume clutch selected is Model MG500A, which operates at an inner race overrunning speed of 2000 rpm. From Figure 2, the 2000 rpm line is drawn horizontally to point of intersection with the MG500A curve. From the point of intersection, draw a line vertically downward to read hours of clutch life (23,000).

Figure 2. Clutch Wear Life Model MG (300A - 700A)

Wear life curves are based on normal use with clutch receiving proper care and lubrication.

- Morse clutch couplings are used in applications that require the coupling of two in-line shafts, such as a motor shaft and a generator shaft.
- Coupling numbers C-3 through C-7 consist of Morse silent chain flexible couplings and are used with clutch models MG300A-700A.
- Coupling bore tolerances are the same as M Series bore tolerances.
- Order clutch couplings and clutch separately. The clutch coupling is normally stocked minimum plain bore. For finished bore, standard rework charges apply.

Coupling Package C7.5 Through C10

- Morse clutch couplings are used in applications that require the coupling of two in-line shafts, such as a motor shaft and generator shaft.
- Coupling numbers C-7.5 through C-10 are used with MG750 - 1000 clutches for inner race overrunning applications and with MR750 - 1000 clutches for outer race overrunning applications.
- Order clutch couplings and clutch separately. The clutch coupling is normally stocked minimum plain bore. For finished bore, standard rework charges apply.

Flanged Stub-Shaft Adapters

The Morse flanged stub-shaft adapter is used when it is impractical to mount a sprocket, gear, sheave or other mechanical device directly to the mounting holes of the M Series clutch models M300A - M1000. The stub shaft diameter is designed to take full advantage of the clutch torque capacity, but may be turned to smaller diameters for an extra charge.

Adapter Number	Clutch Model Number	Dimensions									
		A (Clutch Diameter)		B (Flange Diameter)		C (Overall Length)		D (Groove Width)		E (Stub Shaft Diameter)	
		Inches	mm	Inches	mm	Inches	mm	Inches	mm	Inches	mm

Torque Arms

MG and MO series clutch models can be provided with torque arms. The torque arms are fastened to the outer race by the tapped holes in the ends of the clutch. The outer ends of the torque arms should be restrained to prevent rotation of the clutch, but the torque arms must never be rigidly secured. The torque arms must be free to float to prevent any tendency toward bearing preload.

Torque Arm Number		Clutch Model Number	Dimensions					
Channel	Plate		A (Clutch Diameter)		B (Flange Diameter)		C (Overall Length)

Oil Reservoirs

An oil reservoir attachment is available for applications such as backstops on the high speed shaft of a reducer, backstops on the head shaft of conveyors and applications where clutches are relatively inaccessible or where a minimum of maintenance is required. The reservoir is designed for direct mounting on any stock MG clutch. Reservoirs can only be used where the clutch is in backstop service (inner race overrunning).

Since the direction of rotation cannot always be specified, clutches are shipped with oil seals in both ends of the clutch. When attaching the reservoir to the clutch, the user should remove the oil seal on the reservoir side after determining the proper direction of rotation of the clutch. This seal should not be reused because it is damaged by the removal process. The reservoir is an aluminum casting with cooling fins and has an oil sight gauge.

The sprag type MZEU Series cam clutch is a leader in its class. This one-way clutch began as a ratchet ramp clutch, transitioned to a roller ramp clutch and was later refined into the cam style clutch it is today. The MZEU Series clutch delivers longer life to the clutch mechanism than other types of one way clutches. The MZEU Series cam clutch is suitable for overrunning and middle speed backstopping.

E1 End Cover

E2 End Cover

E3 Torque Arm

E4 End Cover

Features

- Sprag type one way clutch
- High torque and longer life than roller ramp clutches
- A variety of options, such as torque arm, flanges, and cover are available according to your installation requirements

Industries Served

- Food and beverage
- Gearing
- Manufacturing
- Textiles

Field Applications

- Conveyors
- External gearbox backstop
- General equipment backstop for drive shaft

Building Block Principle of Standardization

The MZEU series clutches offer various combinations of covers, which can be assembled to meet a full range of applications. These units incorporate two metric ball bearings between the inner and outer races giving excellent concentricity control.

The outer diameter of the outer race is produced to a close tolerance and can be used for mounting gears, v-belt sheaves, indexing arms, etc. Tapped holes are provided at the face of the outer race and are used to secure the various covers. These tapped holes can also be used for attaching specially designed covers or adapter plates to suit special design considerations. The range of application for these clutches is very extensive and by using the various combinations of covers, it is possible to build units for overrunning applications (MZEU with E1-E2), to prevent reverse rotation (backstopping) MZEU E2-E3 or E3-E4 or to convert linear motion to rotary motion (indexing) MZEU E1-E2 with indexing arm bolted to cover E1.

Part Number Explanation

* Covers ordered separately. Example: MZEU60-E1 cover or MZEU60-E2 cover.

Conveyor Backstop Clutches

Synthetic high-performance grease, continually circulated by rotating cam and roller cage.

Spring-loaded cams are in constant contact with both races for rapid engagement.

Multiple seals. Combination double lip and felt seals helps keep grease in and dirt out.

Full-width rollers maintain concentricity between the races and provide even distribution of bearing load.

Options available

- Taconite seals
- Made-to-order torque arms
- Retaining plates

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

High Capacity, Longer Life, Lower Initial Cost Features

- Combination double lip and felt seals help keep grease in and dirt out for long life and less costly lube oil maintenance
- Synthetic grease lubricant allows operation in temperatures from - 40°F to 150°F
- Plate torque arm design lowers initial cost and provides easier installation
- Rotating cage evenly distributes grease for longer service life
- Larger bore range for a given torque than other units permits use of a smaller clutch for a given shaft size for further cost savings
- Full-width rollers and cams distribute bearing and torque loads evenly over a greater area, a significant improvement over competitive designs
- Rugged, anti-rollover cam design helps prevent sudden loss of load in demanding applications
- Available in torque capacities ranging from 6,500 to 500,000 lb.-ft. and bore sizes from 2 1/4 to 17 2/3 inches

Combination double lip and felt seals help keep grease in and dirt out.

Multiple seals standard on all sizes.

Backstop torque can be calculated using different methods based on conveyor configuration. The methods shown below are for basic selections and are based on CEMA (Conveyor Equipment Manufacturing Association) standards.

Backstop Torque Calculation

$$HP = \frac{T \times N}{5250} \quad \begin{array}{l} N = \text{rpm of clutch at headpulley shaft} \\ T = (\text{lb-ft.}) \text{ torque} \end{array}$$

N = RPM @ headpulley shaft =

$$\text{Torque CB} = \frac{SF \times HP \text{ Total} \times 5250}{N}$$

Bucket Elevator Backstop Selection

Friction resistance is ignored in the selection due to its small magnitude relative to the elevator capacity.

$$HP \text{ Total} = \frac{QH}{990} \quad \begin{array}{l} Q = \text{Maximum load, tons per hour} \\ H = \text{Vertical height of conveyor (feet)} \end{array}$$

Same nomenclature as conveyor method.

$$\text{Torque CB} = \frac{SF \times HP - \text{Motor Nameplate} \times 5250}{N}$$

Motor Breakdown/Locked Rotor Torque Method

Selection is based on the following formula:

Depending on motor breakdown torque, apply the following service factors:

- 1.0 Breakdown torque less than or equal to 175%.
- 1.2 Breakdown torque greater than 175% to 250%.
- 1.5 Breakdown torque greater than 250% TO 400%.

⚠ CAUTION

A backstop is a critical part of the conveyor design. Selection methods shown above should cover most basic conveyor applications. When designing a conveyor, it is necessary that the backstop is selected to handle the maximum load that the conveyor system is designed to handle. Consult Application Engineering at 1-800-626-2093 for backstop selection where conveyor design deviates from the methods shown.

Pre-installation

1. Before installation, check the direction of shaft rotation during operation, often referred to as free shaft rotation. The backstop clutch overruns in this direction and is indicated by stamped rotational arrows on both ends of the clutch inner race.
2. It is important that the clutch fit the shaft properly. These clutches are intended to be installed with a slip fit-interference or shrink fits are not recommended. Bore tolerances and standard keyway dimensions are shown below.

Dimensions - Inches

Nominal Shaft and Bore Dia.		Bore Tolerance	Standard Keyway Width* and Depth
Over	Thru	Nominal - .000	
2 1/4	2 3/4	+ .0020	5/8 x 5/16
2 3/4	3 1/4	+ .0020	3/4 x 3/8
3 1/4	3 3/4	+ .0020	7/8 x 7/16
3 3/4	4 1/2	+ .0020	1 x 1/2
4 1/2	5 1/2	+ .0025	1 1/4 x 5/8
5 1/2	6 1/2	+ .0025	1 1/2 x 3/4
6 1/2	7 1/2	+ .0030	1 3/4 x 3/4
7 1/2	9	+ .0030	2 x 3/4
9	11	+ .0035	2 1/2 x 7/8
11	13	+ .0040	3 x 1

* Width tolerances are plus .002 minus .000; keyway depth is nominal plus .010 tolerance.

3. Use only parallel keys, do not use tapered keys. The key should be tight along both sides and in contact with the keyseat. Clearance has been allowed along the top. The key should not extend beyond the length of the clutch. Cover plate on shaft end is recommended for key keep.

Installation

1. The shaft must be clean and free of burrs. Coat both shaft and key with oil, grease or a similar substance to ease installation.
2. Double check shaft rotation and arrow marks on the end of the clutch inner race to ensure correct rotational direction.
3. Push the backstop clutch on the shaft by applying pressure only to the end of the inner race. If hammering is required, use only a lead or rubber headed hammer to avoid damage to the inner race end. Do not hit the clutch outer race or seal support as internal damage may result. Exercise caution during installation to prevent seal damage.
4. Secure backstop clutch in position on the shaft. Use lock washers, snap rings, lock collars, end plates, adjacent components or similar items to hold clutch in position.

Installation of Torque Arms

Installation of Torque Arms

Torque Arm Mounting:

1. Restrain end of the torque arm to prevent rotation either by use of a pin or angle irons. Do not rigidly fasten the torque arm end.
2. Make sure the torque arm is free to move axially to prevent any preloading of the clutch bearings, due to shaft movement, misalignment or distortion of both conveyor frame and shafting.

3. Make sure that foreign material or ice cannot accumulate on the torque arm end to restrict its movement.
4. When using a pin, its diameter must be smaller by 1/16 inch than the hole in torque arm.
5. Torque arm may be mounted at any desired angle.
6. Make sure that the mounting surfaces of the clutch outer race and torque arms are clean and free of foreign particles, rust, or oil to ensure proper mounting.
7. Tighten torque arm mounting bolts to the following torque values. Use only ANSI grade 8 bolts minimum as supplied.

CB-45 to CB-500

CB-7 to CB-30

Bolt Size	Torque
1/2-20 UNF	110 lb. - ft.
5/8 -18 UNF	220 lb. - ft.
3/4 - 10 UNC	375 lb. - ft.
7/8- 9 UNC	580 lb. - ft.
M24xP3.0	822 lb. - ft.
1-8 UNC	865 lb. - ft.
M36xP4.0	1634 lb. - ft.
1 1/4 - 7 UNC	1750 lb. - ft.
M42xP4.5	2855 lb. - ft.

For plated bolt, reduce torque by 25%.

Sealing Options

Purging seals are available for harsh, contaminated environments. With the torque arm protection, this sealing system provides 4-way protection by using double-lip seals, a grease chamber and an outer chamber through the torque arm. Custom sealing systems are available upon request. Consult Application Engineering for details.

Retaining Plate

Retaining plates offer a means of positively securing the conveyor backstop clutch to a mating shaft and to prevent the key from walking. The retaining plate bolts to three drilled and tapped holes machined in the inner race. An additional hole provided in the plate is intended to align with a drilled and tapped hole machined in the end of the shaft.

Lubrication - Grease

- A. Morse CB clutches are prelubricated with Exxon Beacon® #325 grease. This grease is acceptable in environments with temperature ranges from -40°F to 150°F (-40°C to 65°C). Consult Application Engineering for lubricants beyond this temperature range.
- B. When relubrication is deemed necessary, remove one plug of the four found in the outer race of the clutch and replace with a zerk fitting. When relubricating, remove another plug opposite the grease fitting and pump grease into the clutch until grease flows freely from the plug opening. Replace the plug.
- C. Do not use lubricants that contain EP additives, as these are detrimental to the operation of the backstop.
- D. Use of non-compatible grease could cause clutch failure; contact Application Engineering when using grease other than specified.

Continuous Enhancements, Reliable Clutches

- ① - **High-Strength Outer Race** - Made from high carbon alloy steel, our precision-ground outer race provides fatigue life reliability.
- ② - **Rotating Bearing Retainer** - Located flush with the outer race, this retainer contains evenly spaced, hardened steel balls to provide equal distribution of load for optimized concentricity between the inner and outer races.
- ③ - **Hardened Steel Ball Bearings** - Individually formed from hardened chrome alloy steel, the balls are secured within the retainer to provide concentricity and equal distribution of radial load within the clutch.
- ④ - **Precision-Ground Inner Race** - Similar to a 6000 Series metric bearing, the ball pathway and cam wear surface are hardened and ground to enable rapid cam engagement and low drag operation.
- ⑤ - **Durable Cam-Cage** - Made from molded nylon, the cam-cage provides equal spacing between each cam. When cams articulate within the cage, cam engagement is uniform providing equal distribution of load and more uniform stress on the cams and inner race.
- ⑥ - **Heavy-Duty Garter Spring** - Located within the cam cage, the energizing garter spring creates the drag torque needed for accuracy of cam engagement.
- ⑦ - **Profiled Cams** - Manufactured from high carbon steel, the cams carry high compressive loads when the clutch is locked and transmitting torque.
- ⑧ - **Lightweight Retaining Endplate/Dust Shield** - Attached to the outer race, the end plate helps retain lubrication and protect components within the clutch assembly. Felt and contact lip seal designs are available.

Morse brand KK clutches incorporate a compact cam clutch with built-in bearing support. This unique construction combines a cam clutch with a 6200 Series metric ball bearing for use in applications ranging from exercise equipment to industrial machinery. This general purpose clutch is intended for backstopping, indexing and overrunning applications and can be utilized with both oil and grease lubrication.

Part Number Explanation

KK 25 1K 2GD

KK 25 2K 2GD

Morse KK clutches incorporate a compact cam clutch with built-in bearing support. This unique construction combines a cam clutch with a 6200 Series metric ball bearing for use in applications ranging from exercise equipment to industrial machinery. This general purpose clutch is intended for backstopping, indexing and overrunning applications and can be utilized with both oil and grease lubrication.

Industries Served

- Fitness
- Manufacturing
- Printing
- Textile

Field Applications

- Electric motor backstops
- Exercise equipment
- Household appliances
- Pump backstops

Enhancements

- New sizes added
- New sealing and shielding options
- Both inner and outer race keyway options

KK-1K
(keyed inner)

KK-2K
(keyed inner and outer)

Dimensions in mm

* The dimension of t2 for KK25-2GD 1K is 0.5 mm shallow compared to DIN 6885. 3. Process the keyway on the shaft 0.5 mm deeper to use DIN.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

The NSS Series clutch is available in 12 sizes and is designed with the same overall dimensions as a light metric series ball bearing. The inner race offers a key seat and the outer race press fits into the housing. The clutch is furnished with protective oil and must be lubricated before operating. These clutches do not have bearings to support radial force, so additional bearing support is required. The NSS Series clutch is excellent for applications where space is restricted, and is suitable for overrunning.

Lubrication

1. Oil lubrication is recommended.
2. Do not use greases or lubricants with EP additives.

Installation and Usage

1. The NSS series cam clutch is designed for press fit installation. Correct interference dimensions must be maintained to obtain maximum clutch performance.
2. Make sure the housing has enough strength to withstand the pressure required for the press fitting installation of the clutch. The internal diameter of the housing should meet the H7 tolerance.

Features

- Sprag type one way clutch
- High torque and longer life than roller ramp clutches
- Full metric design
- Overrunning speed is higher than roller ramp clutches

Industries Served

- Food and beverage
- Gearing
- Printing
- Textile

Field Applications

- Exercise equipment
- Food processing equipment
- Printing presses
- Roll conveyors

Installation and Usage (continued)

- When installing the clutch, mount it with a type 62 bearing to avoid radical force, since this clutch does not have any bearings inside.
- Confirm the direction of rotation before installation.
- The recommended shaft tolerance is H7, and the key profile should be in accordance with the following standard.
- NSS-8 – 12.....DIN 6885. 1
- NSS-15 - 60DIN 6885. 3
- Suitable surface pressure of the key should be selected according to your company design standards.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

The NFS Series clutch is available in 13 sizes and is designed with the same overall dimensions as a medium metric series ball bearing. The NFS Series clutch offers approximately twice the torque capacity of the NSS Series clutch. The inner race contains a key seat and the outer race is designed with European key slots. The clutch is furnished with protective oil and must be lubricated before installation. In addition, bearing support is required.

Lubrication

1. Oil lubrication is recommended.
2. Do not use greases or lubricants with EP additives.

Installation and Usage

1. The outer race of the NFS Series cam clutch is designed for press fit installation to the housing. Correct interference dimensions of the outer race must be maintained to obtain maximum clutch performance. The internal diameter of the housing should meet the H7 tolerance. Keyways should be made in the end faces of the clutch for proper installation.
2. Make sure the housing has enough strength to withstand the pressure required for the press fitting installation of the clutch.

Features

- Sprag type one way clutch
- High torque and longer life than roller ramp clutches
- Full metric design
- Overrunning speed is higher than roller ramp clutches

Industries Served

Installation and Usage (continued)

- When installing the clutch, mount it with a type 63 bearing to avoid radial force, since this clutch does not have any bearings inside.
- Mount the clutch on the shaft by rotating it in the direction marked by the arrow shown on the clutch plate.
- The recommended shaft tolerance is H7, and the key profile should be in accordance with the following standard.
 NFS-12 DIN 6885. 1
 NFS-15 – 80 DIN6885. 3
 Suitable surface pressure of the key should be selected according to your company design standards.

Part Number Explanation

The B200 Series clutch is designed with a full complement of cams retained in the outer race and requires bearing support, lubrication and sealing. The B200A clutch is primarily used for backstopping applications, such as a pump backstop application, but can be used for indexing or overrunning applications as well. The outer race diameter is the same as the metric 200 series ball bearing to facilitate assembly adjacent to the ball bearing.

* Same O. D. as 200 series ball bearing.

Model Number	Torque Capacity		Shaft Overrun rpm Max.	Dimensions			
				A (Overall Diameter)		B (Width)	
	lb-ft	N-m		Inches	mm	Inches	mm

B210A	575	780	1800	3.541 / 3.543	89.95 / 89.99	1.250	31.75

Key furnished with each clutch.

Lubrication

Series B200A series clutches are furnished prelubricated with a special light grease. In service they may be either oil or grease lubricated. Lubrications with EP additives should be avoided.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Features

- Shaft mounted
- Primarily backstop applications, may also be used in indexing and overrunning applications
- For freewheeling applications, the shaft that the clutch is mounted on should be the overrunning member
- Clutches require bearing support to ensure concentricity between inner and outer races. Taper on this shaft should not exceed .0002 inches per inch.
- No inner race (shaft is used as inner race)

Industries Served

- Fitness
- Food processing
- Textile

Field Applications

- Gearbox manufacturing
- Winches, hoists
- Industrial transmissions
- Pumps
- Shaft mount reducers
- Textile drives

Mounting Data

* Shaft (not included) - harden to obtain RC 58-62 and .050 - .060 case depth after grinding. Concentricity between shaft and housing bore should not exceed .002" T.I.R.

Model Number	Dimensions			Use with Bearing Number	Weight

Mounting Data

* Required shaft diameter - harden to obtain Rc58-62 and .050 - .060 case depth after grinding. Grind to 16 microinch finish. Concentricity between shaft and housing bore should not exceed .003" T.I.R. Adequate bearing support must be provided between the shaft and clutch housing to maintain proper concentricity and support radial loads.

Features

- PB series clutches feature precision formed cams, which provide highest torque capacities size-for-size combined with excellent wear life.
- These models are suitable for general purpose applications - overrunning, indexing and backstopping.
- Models PB-5A through PB-16A contain sealed construction and snap ring groove provided on hub of each clutch for attachment of gear, sheave, etc.

Clutch is not to be used as a coupling. Specify direction of rotation when ordering.

Lubrication

PB series clutches are prelubricated with grease and are ready for installation. These units can be operated in ambient temperatures of +20° F to +125° F.

All filler plugs are 1/4-28. All models have three filler holes at 120° except PB-3A, which has only one. Clutch models PB-5A through PB-16A can be oil lubricated by specifying on order.

Features

- Best used on indexing applications
- One end of clutch tapped for attaching sprockets, gear or ratchet arms
- May be used on overrunning and backstopping applications
- Intended for use on end of a shaft
- For freewheeling applications, the inner race should be overrunning

	1.938, 2.00 (.50 x .250)	49.21, 50.80 (12.70 x 6.35)				

Installation and Lubrication

- Before installation a snap-ring ball bearing must be inserted in the counterbored end, complete with a gasket or seal to retain the lubricant.
- Always apply pressure on the inner race, never on the outer race when installing. It is important that the clutch fit snugly on the shaft and have proper fitting keys.
- HT series clutches are furnished with a light lubrication prior to shipment only as an anticorrosive measure and must be fully lubricated after the snap-ring ball bearing has been incorporated by the customer.
- Use Type A automatic transmission fluid and fill until oil runs out between hub and end cap.

Industries Served

- Equipment rebuild

The cam of the BR Series clutch is designed to lift off and has no contact with the inner and outer race when it overruns. This is due to centrifugal force and is known as a lift off type. These cam clutches are suitable for overrunning: high speed inner race/low speed engaged outer race or backstopping-high speed inner race overrunning.

Features

- Lift-off cam design provides contact free operation between the cams and the races for increased wear-life
- Symmetrical design allows operation in either direction
- External bearing support must be provided for concentricity between the housing and shaft

Industries Served

- Gearing
- Manufacturing
- Packaging
- Textile

Field Applications

- Conveyors
- Shaft mount reducers
- Vertical shaft backstop

Grease Lubrication

- Morse recommends an NLGI, Grade 1 or 2 premium bearing grease, mineral oil based in a lithium soap thickener, non-EP type.
- Synthetic polyurea base fluid greases are also acceptable.
- EP greases (having extreme pressure characteristics) with slippery additives such as graphite or molybdenum disulfide must not be used. They can cause the clutch to malfunction.
- Clutches specified as grease are filled at the factory and are ready-to-use.
- Grease is not recommended for low temperatures or for performance indexing applications.
- Generally relubricate every two months and more often for dirty environments.
- For operation in ambient temperatures over +200°F or below +20°F, consult Application Engineering.

General use: (+20°F to +125°F, NLGI #2)

- Texaco Multifak® AFB 2, Texaco Polystar RB
- Mobilith® SHC 100
- Shell Alvania® #2

Food grade applications (USDA Grade H-1, up to +300°F):

- Keystone Nevastane® HT/AW-1 or -2
- Mobil® FM 101, 102
- Lubriplate® FML-1, FML-2

Note: Not all greases are compatible and clutch performance can be affected.

Oil Lubrication

- Morse standard oil is a multipurpose automatic transmission fluid, good from -20°F to +150°F. For temperatures outside this range, use synthetic ATF oil.
- Oils with EP additives must not be used. They can cause the clutch to malfunction.
- Clutches ordered with oil are partially filled and then drained after factory run-in. Therefore, the clutch must be filled half full with oil before being operated.
- The standard oil lip seal is made from a polyacrylic compound, which is good to +250°F.
- Oil is recommended for indexing applications.

Check the oil level monthly. See the maintenance and installation sheet provided with each unit.

On applications where a press fit is required, do not exceed .001 inch.

Backstop applications which permit or require looser fits than those listed can use the following fits shown below.

Bore sizes up to: Shaft to bore clearance

2.375	.003
4.25	.004
6.00	.004
6.00 and over	.006

Clutch Repair

Morse cam clutches are precision mechanisms made by experienced workmen under careful supervision and high quality control standards; clutch repair requires this same attention which can be provided only by the manufacturer. Clutch should not be disassembled in the field for repair.

Installation and Maintenance

Specific instruction sheets are packed with each clutch which cover the installation, lubrication and maintenance of each unit.

They can also be found on www.emerson-ept.com.

1. Calculate torque to be transmitted:

$$T \text{ (Lb-Ft)} = \frac{\text{HP} \times 5252}{\text{rpm}}$$
2. Determine mode of operation (overrunning, indexing, backstopping). Refer to Modes of Operation on page 8.
3. Select service factor from tables below.
4. Calculate design torque. (Multiply torque from step 1 by service factor).
5. Determine bore requirements of clutch.
6. Determine overrunning speed and overrunning member (inner or outer race).
7. Select clutch based upon:
 - A. Design torque requirements
 - B. Bore size
8. Specify catalog number and bore size as:

Catalog No.	Bore Size	Rotation
MG-600A	1.500/1.4999	See page #9
9. Direction of rotation must be specified for clutch series PB, HT and for clutch models used with couplings and reservoirs.
10. Refer vertical or other special applications to Application Engineering. Supply complete application information including sketch of drive system.

C. Mode of operation
 D. Speed
 Refer to pages 4 through 7 for condensed description and application guide. See also data pages on specific series. Consider M Series clutches for longer life. See page 20 for indexing life. On overrunning and backstopping applications, refer to page 21 for expected wear life data.

Service Factors

Overrunning

Type of Load	Service Factor (All Models)
1. Gradually applied	1.25
2. Suddenly applied - minor shock loads	1.75
3. Suddenly applied - heavy shock loads	2.50
4. Severe shock	5.00

Applications where linear or torsional vibration is present, such as reciprocating engines, or where impact loads occur due to sudden engagement and pickup of high inertia loads, greater service factors should be used. Consult Application Engineering for more information.

Indexing

Load Cycles/Minute	Degrees/Load Cycle	KK	NSS	NFS	200A	B-500	PB-A	HT	M*	MZEU
Up through 150	Less than 90°	1.5	1.5	1.5	2	2	2	1.5	1.5	1.5
Greater than 150	Less than 90°	2	2	2	3	3	3	2	2	2
Up through 150	90° or greater	2	2	2	3	3	3	2	2	2
Greater than 150	90° or greater	3	3	3	4	4	4	3	2.5	3

* Use model MI for applications requiring more than 150 cycles/minute or greater than 90° stroke angle. Also, use MI model when greater accuracy of index is required up to a limit of 1200 load cycles/minute.

Backstopping

Service factors are generally 1.0 to 2.0 where occasional loading occurs and 1.5 to 2.5 where frequent loading is used. The maximum service factor selected is dependent upon overload conditions as specified by the purchaser.

Selection Example

A fan drive requires a clutch to overrun from fan speed to zero speed when power is shut off. The drive consists of a 50 HP motor at 1750 rpm, a 1.7:1 reduction to fan and a fan shaft diameter of 1.500".

Steps	Solution
1. Torque to be transmitted	$T = \frac{\text{HP} \times 5252}{\text{rpm}} = \frac{50 \times 5252}{1030} = 255 \text{ Lb-Ft}$
2. Determine mode of operation	Overrunning
3. Proper service factor	Use 1.25 service factor for fan
4. Design torque	$255 \times 1.25 = 319 \text{ Lb-Ft}$
5. Bore requirement	1.50 inches
6. Overrunning speed and member	Inner race overruns at 1030 RPM to zero
7. and 8. Clutch selection and specification	Clutch which satisfies shaft size, torque and speed is MG-600A/1.50 model no. MG-600A bore 1.500/1.4999 inch dia. w/std. kwy.

Emerson Power Transmission
P. O. Box 687
Maysville, KY 41056
Fax (606) 564-2079**

1. Application: State purpose of clutch and equipment clutch will be used on:
2. Main operating mode: Overrunning _____ Backstopping _____ Indexing _____
3. Power driving clutch: Electric _____ Diesel _____ Gasoline _____ Other _____
Horsepower _____ Hp, at _____ rpm
4. Torque through clutch: _____ lb-feet, at a Driving rpm _____ on the clutch.
5. Load type/(service factor): Gradual (1.5) _____ Sudden load, minor shock (1.75) _____
Sudden load, heavy shock (2.5) _____ Severe shock (5.0) _____
6. Lubrication: Oil _____ Grease _____ Specific type _____ Serviced? _____
7. Environment: Ambient Temp. (F) _____ Exposed to: Dirt, dust? _____ Moisture? _____
8. Shaft diameter (inches) _____ Keyway size, if known _____
Clutch Mounting Position: Horizontal _____ Vertical _____
9. Indexing applications only: Max indexes per minute _____ Degrees per index _____
Hours per day in use _____ Days used per year _____
10. All other applications: Continuous duty, _____ hours per day
If intermittent duty cycle; Driving (%) _____ Overrunning (%) _____ Idle (%) _____
If overrunning; Inner race maximum rpm _____ Outer race max rpm _____
11. Quantity required: This application _____ Annually _____
12. Additional comments?
13. Please provide sketch if possible.

Thank you!

Morse®

Mechanical Clutches

The industry's broadest line of conveyor backstop, overrunning and indexing clutches.

Morse mechanical clutches offer the most complete and versatile selection in the industry. Eleven series of clutches perform three basic modes of operation:

- Overrunning
- Indexing
- Backstopping

These units have set standards of performance, offering:

- Higher overrunning speeds
- Greater torque capacities
- Longer service life

Cam clutches are precision devices that lock the inner and outer races through the wedging action of cams to transmit torque in one direction of rotation while overrunning in the opposite direction of rotation. These units are often referred to as freewheels, sprag, overrunning, backstop or one-way clutches, depending upon their application.

Protect your equipment with Morse and Browning Torque Overload Devices.

Browning and Morse torque overload devices are designed to protect machinery when an overload or jam occurs. Utilizing a torque overload device can help increase production, reduce downtime and prevent costly repairs. Emerson Power Transmission offers eight different types of torque overload devices available in shear pin, ball detent and friction facing designs. These units are available with up to 1800 rpm, 21,500 ft/lbs of torque and at best, can maintain trip torque within $\pm 3\%$ accuracy to meet the needs of the most demanding applications.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Torque Overload Devices

Emerson Power Transmission offers one of the broadest lines of torque overload devices to help you cost-effectively handle a wide range of applications.

Emerson Power Transmission offers torque overload devices for the protection of equipment and machinery with eight types of devices for many applications and uses.

By utilizing a torque overload device you can:

- Help protect against the increasing cost and hassle of overload related damage
- Increase production by reducing downtime

Browning and Morse torque overload devices are suitable for many different applications. Browning shear pin hubs and Browning and Morse torque limiters are a cost-effective solution to help protect primary drives and conveyors. For higher-precision applications such as wrapping or cartoning equipment, Browning Torq/Pro delivers repeatability and accuracy. In applications requiring an ON/OFF switch, such as a press machine or for high-speed applications like packaging conveyors, the Torq/Pro TPZ is the best-suited device. For servo motor driven applications choose the Torq/Pro TPX and for wash-down applications, such as filling equipment, the Torq/Gard is the best solution. If you need application assistance, please contact Application Engineering at 1-800-626-2093.

Torq/Gard

TGC 60

- Size (1/10 of the maximum torque capacity, in.-lbs.)
- Series

If required shaft bushing is ordered separately ex.

60 BU 012

- Shaft size (16th of an inch)
- Bushing kit
- Torq/Gard Size

Bushing kit includes key and set screws. Torq/Gards can be made into couplings by ordering separate components. Single strand TG sprocket kits to bolt on are stocked.

TG 40 A 45 K

- Kit
- Number of teeth
- A-Plate
- #40 roller chain
- Torq/Gard

Includes mounting bolts.

Browning Torque Limiter

T45L x FB

- Specify bore size in inches
- Browning torque limiter with 4.5" OD

Bushing is supplied with Browning torque limiter.
Sprocket for torque limiter is ordered separately 50T45L26.

50 T45L 26

- Number of teeth
- Browning torque limiter with 4.5" OD
- #50 roller chain

Morse Torque Limiter

350A -2 TL x FB

- Specify bore size
- Series
- Number of disc springs (max. 2)
- Overall diameter (3.5 inches)

Required bushing is ordered separately; bushing length determined by sprocket selection.

350 AG 5 26

- Number of teeth in sprocket
- #50 pitch roller chain
- A plate, ground (63 micro-inch)
- Fits Morse TL model 350

Browning Torq/Pro

TP 30 H FB or MPB

- Specify finished bore or min. plain bore
- Springs (light, medium or heavy)
- Model number
- Series

When ordering a Torq/Pro coupling specify Torq/Pro unit, Torq/Pro sprocket, coupling chain and adjoining sprocket.

Browning Shear Pin Hubs and Sprockets

(Page 84)

Features

- Helps prevent damage to machinery due to sudden overload by shearing a necked pin at a predetermined load, allowing the sprocket to rotate freely without the hub
 - New shear pins must be installed to reengage drive
- Bore range 0.38" - 5"
 Torque range 0.88 - 21,572 lb-ft.
 Precision tripping torque ±20%

Morse Torque Limiters

(Page 88)

Features

- Overload protection for mechanical drive systems
 - Adjustable spring pressure determines overload setting and reengages drive when overload condition subsides
 - Also available as a torque-limiting coupling
- Bore range 0.38" - 4.87"
 Torque range 1 - 6,300 lb-ft.
 Precision tripping torque ±25%

Browning Torque Limiters

(Page 95)

Features

- Torque control devices that slip under excessive load
 - Adjustable spring pressure determines overload setting and reengages drive when overload condition subsides
 - Effective overload protection for a wide variety of applications
- Bore range 0.5" - 2.5"
 Torque range 67 - 733 lb-ft.
 Precision tripping torque ±25%

Browning Torq/Pro

(Page 97)

Features

- Overload protection with increased accuracy
 - Adjustable spring pressure transmits torque through a ball-in-detent arrangement
 - Resets to the same initial position
- Bore range 0.19" - 5.12"
 Torque range 2.6 - 5,270 lb-ft.
 Precision tripping torque ±10%

Browning Torq/Pro X (TPX)

(Page 104)

Features

- Patent pending, innovative ball and wedge mechanism, helps prevent backlash
- Ball and pocket are uniquely designed to fit together in only one position
- Adjust trip torque by simply turning the adjustment nut
- Torque setting can be easily verified by checking the torque scale and indicator

Bore range 0.28" - 2.75"
 Torque range 1.25" - 578 lb-ft.
 Precision tripping torque $\pm 3\%$

Browning Torq/Pro Z (TPZ)

(Page 108)

Features

- TPZ is reset by applying a load in the direction of the shaft, either manually or by means of external force.
- Shaft revolution can be started or stopped at will- it can be used as a mechanical ON-OFF clutch
- The ball and pocket act as the torque transmission element and are uniquely designed to fit together in only one position

Bore range 0.31" - 1.96"
 Torque range 1.77 - 332 lb-ft.
 Precision tripping torque $\pm 10\%$

Browning Torq/Gard

(Page 111)

Features

- Precise overload protection with an elegant yet rugged cam-in-detent system
- Fast reaction and automatic reset provide unsurpassed protection
- Detector plates, coupling options and other accessories enhance design flexibility

Bore range 0.75" - 2.44"
 Torque range 1 - 675 lb-ft.
 Precision tripping torque $\pm 5\%$

Browning Axial Gard (TPA)

(Page 117)

Features

- High accuracy: Trip load doesn't change over $\pm 15\%$ after many trips
 - Torsional stiffness of axial direction is high allowing the axial gard to prevent backlash
 - Trip load is easily set by rotating the adjustment screw - trip loads in either direction are the same
- Precision tripping torque $\pm 10\%$

Select the most suitable torque overload devices to cover all your complex application needs.

Designed to help protect your equipment!

Browning Torq/Pro

Browning shear pin hubs have the most basic design. When the pre-determined overload occurs, the pin breaks. The inner part of the hub remains in place, while the outer part rotates freely, allowing the drive to idle.

Morse and Browning torque limiters are more sophisticated and utilize friction facings to allow slipping when an overload occurs. Both units reengage automatically after the overload has been removed.

Browning Torq/Pro, Torq/Pro X and Torq/Pro Z (refer to image above) all function using a ball and detent design, which allows for one position engagement and practically eliminates backlash. Torque is transmitted from the center flange through the ball to the detent in the hub. When an overload occurs, the ball is released and rolls between the plate and the hub.

Browning Torq/Gard has a spring-loaded cam follower seated in a single hub cam detent causing the hub and clutch body to rotate as a unit. When the preset torque limit is exceeded by an overload condition, the follower is released from the cam detent disconnecting the hub from the body.

The Browning axial gard functions different than the other torque overload devices as it is meant for linear applications. The thrust load from the slide shaft leads to the case transferred by the steel balls. When the thrust load exceeds the setting load the steel balls run on and the slide shaft becomes free.

Browning shear pin hubs are designed to prevent damage to machinery due to sudden overload or jamming by shearing the necked pin at a predetermined load. The inner part of the hub is keyed to the shaft and remains stationary while the outer part, to which the sprocket is bolted, rotates freely after pin breakage, allowing the drive to idle.

Browning shear pin hubs and sprockets consist of three separate stock parts:

- Steel sprockets
- Hub assembly
- Malleable bushing

Each part is individually packaged. The hub assembly includes sprocket mounting bolts, two hardened liners and one minimum strength shear pin. Additional liners and shear pins are available from stock in a wide range of shear strengths. Sprockets are available in pitches and numbers of teeth shown on page 85, machined to fit shear pin hubs. Stock Browning type "A" sprockets with other numbers of teeth can be machined to fit these hubs. Bushings are stock Browning split taper bushings. Both Type 1 and Type 2 shear pin hubs are grease packed to provide low friction rotation in case of pin breakage. Type 2 hubs are provided with a grease fitting for relubrication.

* Note: These sizes require extra capacity alloy steel shafting to ensure against shaft distortion under peak load. The above table is representative of average field conditions. Minimum shaft diameters shown are based on the standard shaft size formula:

$$D = \sqrt[3]{\frac{5.1T}{S}} \text{ where}$$

D = Shaft diameter in inches

T = Torque in inch pounds

S = Allowable torsional shearing stress of 12000 lbs/in²

For severe or unusual applications, refer to Application Engineering at 1-800-626-2093.

Torque ratings shown are in inch pounds and are based on 60,000 pounds ultimate shear strength.

Horsepower ratings are shown at 100 rpm. Horsepower varies directly with speed, therefore the horsepower for 200 rpm would be twice that shown, etc. Shear pin hubs should not be used on high speed drives.

Use only Browning shear pins with Browning shear pin hubs.

Selection of Shear Pin Hubs and Sprockets

In selecting Browning shear pin hubs and sprockets, check torque requirements (including a suitable starting load factor of 1.5 or more) and select a hub and pin neck diameter to suit, see Table 6 above. Also check selected hub for size of sprocket and bore range. When shear torque is not known, it may be computed from either of the following formula:

$$1. T = \frac{63000 \times \text{HP} \times F}{\text{RPM}}$$

or

$$2. T = \frac{D \times \text{CL} \times F}{2}$$

where

T = Torque in inch pounds

D = Pitch diameter of sprocket in inches

HP = Horsepower

RPM = Speed in revolutions per minute

CL = Chain pull in pounds

F = Starting load factor, usually 1.5 or more

Both overload service factors and starting load factors must be considered when designing a drive with a shear pin hub, but both are not considered at the same time. Overload service factors are expressions of drive life desired in chain and sprocket drives while the starting load factor reflects only the starting torque that must be overcome by the shear pin. Therefore, the drive

should be calculated on the overload service factor, but the shear pin selection should be made on the starting load factor.

Example:

A chain drive with shear pin protection is desired from a speed reducer to a belt conveyor. The speed reducer is driven by a 10 HP normal torque motor. Speed reducer output shaft is 1 1/4 diameter and output speed is 550 rpm. Conveyor shaft is 1 7/16 and speed is 192 rpm. Center distance is approximately 30".

A. For example if the overload service factor is 1.2 and a drive consisting of a #60 chain, 122 links long, a 21 tooth driver sprocket, and a 60 tooth driven sprocket will deliver 12.3 HP, which is ample.

B. Using a starting load factor of 1.5, the torque is:

$$T = \frac{63000 \times 10 \times 1.5}{192} = 4922 \text{ inch pounds}$$

C. From Table 6 above, select the hub and shear pin with the torque value nearest 4922 inch pounds. An SHP1 hub with a 4P pin has a torque rating of 5380 inch pounds, which is ample.

D. Required drive is as follows:

1—60P21 sprocket, P1 1 1/4 bushing

1—SHP1 hub with 4P shear pin and S60P60 sprocket

1—#60 riveted chain, 7.625 feet complete (121 links plus 1 connecting link).

Dimensions for Machining Parts to Fit Stock Shear Pin Hubs

Table 7

Part No.	B	C	D	P. C.
SHH1	3.252"	9/16"	13/32"	4.500"
SHP1	4.502	13/16	17/32	6.5
SHQ1	6.002	15/16	17/32	8.625
SHR1	7.502	15/16	21/32	11.25
SHR2	7.502	1 5/16	23/32	14
SHS2	8.002	1 7/16	25/32	16

Exercise extreme care in machining the bore to avoid undesirable run-out of the part. Use Browning stock sprockets shown in Table 4, page 85 whenever possible. These sprockets are precision machined and ready to use.

Table 8 Minimum Possible Sprocket Sizes for Stock Shear Pin Hubs

* These sizes of hubs should not be used with these sizes of chain.

Made-to-Order Shear Pin Sprockets

In addition to the stock shear pin hubs and sprockets shown on pages 85 and 86, many sizes of the shear pin sprockets can be made-to-order in either finished bore or bushing type.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

In response to industry needs, Morse introduced the first spring loaded, friction type protective device in 1949, called the Morse torque limiter. As the originator of the torque limiter, Morse has gained wide experience in its design and application. Through the years, Morse has successfully adapted torque limiters to thousands of conveyor, material handling and agricultural applications.

The Morse torque limiter is a protective device that limits torque transmitted in a drive system by slipping when the torque demand exceeds a preset value as a result of shock loads, overloads or machine jams. It automatically reengages when the overload torque has passed; no resetting is required. The Morse torque limiter helps prevent machine damage and eliminates costly downtime. Using spring loaded friction surfaces for its operation, the Morse torque limiter presets slip torque by adjustment of the spring force. This device can be used with a sprocket, gear, sheave or flange plate as the center member that is clamped between two friction facings.

The Morse torque limiter is available in seven sizes – 150, 250A, 350A, 500A, 700A, 13" and 20". Morse has over 50 years of experience in designing and applying torque limiters as trouble-free, long lasting devices to protect machinery.

Features

- Simple design
- Economical
- Easy adjustment
- Compact
- Wide torque range
- Dependable
- Minimum maintenance
- Durable
- Safe, non-asbestos, no-lead pads
- Replacement parts in stock
- Friction facings

Integral hub and pressure plate is high-grade cast iron with a 63 micro-inch finish on the friction facing side. Sturdy ribbed construction aids in heat dissipation, helps prevent deflection under spring load and maintains contact between the friction facing and pressure plate. The resulting uniform distribution of the spring load over the friction surfaces minimize face pressure (psi) and friction facing wear and provides accurate slip control.

Unbonded friction facings are made of non-asbestos, non-lead material, providing a high coefficient of friction and long wear.

Sintered steel bushing on which the center member and friction facings rides are coated with a dry film lubricant; therefore, no oil is present to contaminate friction facings and reduce torque capacity. The bushing "free floats" on the hub. Morse offers

a wide selection of bushing widths in all torque limiter sizes, permitting close matching of center member and bushing width to minimize bearing pressure and promote longer bushing life.

Pressure plate is designed with flats to fit securely on the hub with a 63 micro-inch finish on the facing side.

Disk spring provides axial load to the pressure plate, friction facings and center member.

Pilot plate serves as "back-up" to the pressure plate on the 500A and 700A models and ensures even distribution of load over the full diameter of the disk spring. The tabbed lockwashers acts as a pilot for models 250A and 350A.

Three bolt adjustment nut on the 500A and 700A sizes make adjustment easy. This principle was originated by Morse and has been standard for many years on 13" and 20" size torque limiters.

Multiple torque adjustment settings are provided on sizes 250A and 350A. Adjust the single hex nut with adjustable or open end wrenches and lock in position with a lock washer.

Torque limiter capacities are directly proportional to the spring force applied to the friction surfaces and it is a simple matter to increase capacity by increasing spring force – but not without sacrifice. The higher the unit load or pressure (psi) on the friction surfaces, the quicker the friction facings will deteriorate as they slip against the pressure plates and center member. If ratings are established on the basis of extremely high friction face loadings, the torque limiter serves as nothing more than a shear pin mechanism, instead of the solution developed by Morse.

The spring is designed so that its force varies little over a wide deflection range at the rated capacity of the torque limiter. This provides load re-engagement near the pre-set torque level as the friction facing wears.

Torque Limiter Accessories

Ground Sprockets

As a stock item, Morse offers “A” plate sprockets with faces ground to 63 micro-inches and bores sized specifically for torque limiter applications. Select your ground sprocket from the stock sizes listed on page 92. The sprocket will be shipped “off-the-shelf” as Morse continues to deliver prompt and efficient service.

Couplings

For overload slip protection combined with the ability to couple driving and driven shafts, Morse offers a torque limiter coupling in four sizes. This device consists of a stock torque limiter and a roller chain type coupling.

Morse also offers 13" and 20" torque limiters. See the following pages for details.

Part Number Explanation

350A -2 TL x FB

- Specify bore size
- Series
- Number of disc springs (max. 2)
- Overall diameter (3.5 inches)

350 AG 5 26

- Number of teeth in sprocket
- #50 pitch roller chain
- A plate, ground (63 micro-inch)
- Fits Morse TL model 350

Required bushing is ordered separately; bushing length determined by sprocket selection.

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Sprockets must be counter bored to fit torque limiter.
 * Stock minimum plain bore (MPB) only; require rebore and face grind for torque limiter use.
 ** Model 150 does not use bushing. Sprocket bore should be .876 - .878.

Torque Overload Devices

Sprockets

For more precise torque setting and for applications where slippage may be frequent, use a ground center member (63 micro-inch). Rated torque capacity can only be obtained with dry friction facings and with a ground center member, which has been run-in for 4 minutes at approximately 650 rpm at a torque setting of 70 to 80% of the 1 spring rating - rate of run-in is

not to exceed 80 rpm. Center member faces should be flat, parallel, square with bore, and free from rust, scale and oil for optimum torque limiter performance. If center members are not in accordance with these specifications or are unground, torque limiter capacity will be erratic and generally lower than capacity with ground center members.

Ground Sprockets

These "A" plate sprockets are stock items that are furnished with ground faces. For most economical drive designs, use these stock sprockets with the Morse torque limiter.

Note: Bushing must be ordered in addition to sprocket.

The torque limiter coupling combines overload slip protection with the ability to couple driving and driven shafts. Some angular and parallel misalignment can be accommodated by the double roller chain design.

Note: Coupling assembly includes “A” plate sprocket, “B” sprocket, bushing and double strand roller chain. The torque limiter must be ordered separately.

4"	5"	+ .004 - .000

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Selection

1. Select a torque limiter size with a torque capacity that slightly exceeds the required slip torque for the application.
2. Confirm the required torque limiter hub bore is available. Stock finished bores are shown in this catalog.
3. Check "minimum sprocket teeth and bushing length" table to determine that the specific sprocket to be assembled in the torque limiter is compatible.

4. If a slip condition is expected to persist for more than a few seconds, refer to the maximum duration chart. Torque limiters subjected to extended slipping beyond the recommended time limit may be damaged and may malfunction.

Note: Because of widely varied applications, no maximum speed is specified, however, the effects of sprocket run-out on a specific application should be considered.

For longest wear life, mount torque limiter on the "low-speed" shaft of a drive.

250A Torque Limiter

350A Torque Limiter

500A Torque Limiter

700A Torque Limiter

Browning torque limiters are torque control devices that slip under excessive load but automatically carry the desired load after the excess has been removed. The device can be easily adjusted to slip at a desired overload, and automatically reengage when overload is removed. Overload should be removed promptly since prolonged slippage can be detrimental to the friction disc. Generally, no resetting is required after the torque limiter has slipped. Torque limiters help prevent machine and product damage and costly downtime caused by shock loads, overloads or machine jams but should not be used as clutches.

Torque limiters are primarily used with sprockets and Browning stocks a wide variety of sizes as indicated. Other stock Type "A" sprockets can be reworked for torque limiters.

Maximum torque ratings can be obtained by using a drive member with center flanges ground to approximately 100 micro-inches surface finish. Rough or rusty center flanges will cause erratic torque values and rapid wear on friction discs. Oil or grease on the center flange or friction discs will reduce torque values.

Browning torque limiters are friction-type torque overload devices that reset to any position. Torque limiters offer:

- High accuracy
- Low cost
- Compact
- Reversible
- Non asbestos pads
- No need to reset

Industries Served

- Material handling
- Agricultural
- General industrial
- Aggregate processing
- Conveyor manufacturing
- Food and beverage

Applications

- Primary drives
- Conveyors
- Wrapping and cartoning equipment
- Industrial equipment
- Agricultural equipment

Torque Limiter Adjustment

Adjustment of Browning torque limiters is fast, simple and positive. Only an open end wrench and a socket head setscrew wrench are needed.

1. Back-off the three cap screws until the points are recessed in the threaded adjusting collar.
2. Tighten the threaded adjusting collar by hand and then tighten the cap screws with an open end wrench until the heads bottom.
3. Try the unit in its application and if further adjustment is necessary, loosen cap screws until points are recessed in the adjusting collar. Torque can also be checked by applying tension to one strand of chain with a spring scale or other means.
4. Tighten or loosen the adjusting collar as needed, then retighten the cap screws until the heads bottom.

Torque Limiter Selection

When the torque at which the device should slip is determined, simply choose a torque limiter from Table 10, which has a maximum torque rating as great or greater than the required torque. Check Table 11 to see if required bore is available. It is a good practice to select the torque limiter with a maximum torque rating reasonably greater than the required torque when possible. Do not use torque limiters on high speed drives.

Example:

To prevent damage to a conveyor system, a device is needed on the head pulley shaft that will slip at 2100 inch pounds of torque. Shaft size is 1 1/4" diameter.

From Table 10, note that a T45L torque limiter will produce a maximum torque of 2800 inch pounds. It is also available with a 1 1/4" bore. The proper torque limiter is T45L x 1 1/4.

Part Number Explanation

T45L x FB

- Specify bore size in inches
- Browning torque limiter with 4.5" OD

Bushing is supplied with Browning torque limiter.
Sprocket for torque limiter is ordered separately 50T45L26.

50 T45L 26

- Number of teeth
- Browning torque limiter with 4.5" OD
- #50 roller chain

Browning stock sprockets for torque limiters are ground for proper release and re-engagement. Stock Type A sprockets can also be reworked for torque limiters.

Design Features

Features

- One position type: the non-symmetric arrangement of balls and pockets allows only one engagement position.
- Automatic resetting: once the overload is removed, it reengages automatically by rotating a driving member.
- Accuracy of trip torque within $\pm 10\%$: even with repeated tripping the precision remains within $\pm 10\%$.
- Easy torque setting and adjusting: by tightening or loosening the adjusting nuts (bolts), the desired torque can be easily set
- Visual torquemeter: the indicator and the torquemeter can confirm the setting torque.

Browning Torq/Pro is a release-type ball-detent torque overload device with a single position reset configuration and offers:

- Improved accuracy
- Simple design
- Reversible
- Torque set scale
- Switch detector plate

Structure

1. Torque is transmitted by the balls and pockets. The irregular arrangement of the balls and pockets results in only one position engagement.
2. During normal machine operation torque will be transmitted from the center flange through the balls to the pockets with the hub. If overloaded the balls are released from the pockets and roll between the plate and the hub. On tripping, the needle bearing provides smooth and light rotation.
3. On tripping, the center flange will move in the direction 2-3 mm, then the sensor plate catches the overload.
4. Adjust torque by tightening the adjusting nuts (bolts). The indicator and torquemeter show set tripping torques.

Production Protection

There is a strong push toward automating manufacturing facilities and equipment. Depending on material flow, various machines are systematically coordinated to achieve high efficiency, productivity and performance in the total production layout. In this situation, however, small mishaps can occasionally add to total system downtime and subsequent losses. Browning Torq/Pro is based on a design concept to not only help protect machines from overload but also minimize downtime, which may be caused by the problems of just one of the interacting machines.

Part Number Explanation

When ordering a Torq/Pro coupling specify Torq/Pro unit, Torq/Pro sprocket, coupling chain and adjoining sprocket.

Selecting Torq/Pro

Like other overload protection devices, position the Torq/Pro at the nearest place to the driving part where overload will occur.

1. Decide the trip limit torque from the maximum torque limit, strength of the driving part and the expected overload.
2. Confirm the bore size and rpm.
3. Select a suitable size from the ratings table.

Like other overload devices, it is best to position the Torq/Pro nearest the driven equipment where the overload is most likely to occur.

Tripping torque should be 25% greater than the operating torque to compensate for motor starting torque and intermittent, shock and reversing loads.

Tripping Torque = Operating Torque × SF

$$\text{Torque (In. Lbs.)} = \frac{\text{Horsepower} \times 63025}{\text{rpm}}$$

$$\text{Horsepower} = \frac{\text{Torque (In. Lbs.)} \times \text{rpm}}{63025}$$

1. Determine the tripping torque by either the HP or torque formula shown.
2. Select the correct Torq/Pro based on this rating.
3. Check for max. rpm and confirm stock bore size.

Installation

1. The torque of the Torq/Pro is set at the minimum value when shipped. Please check to ensure that the indicator is pointing to zero on the torque scale.
2. Loosen the fit-drive setscrew of the adjustment nut and remove the lock plug.
3. Look at the tightening graph to determine the angle to which the adjustment nut must be tightened to produce the trip torque determined above. The torque scale is divided into increments of 60°. First turn the adjustment nut to an angle 60° before the angle determined from the graph, install the Torq/Pro onto the machine, and do a trip test. Then gradually tighten the nut until the required torque is reached.
4. After the torque is set, insert the lock plug and tighten the screw with hole so that it holds loosely.
5. Do not turn the adjustment nut beyond the largest value on the torque scale. If this is done, the spring will not have sufficient flexible leeway and the device will lock when tripping occurs.

Torque Setting

TP-08, 12, 16

1. Torque is set with adjustment nut.
2. Tighten the adjustment nut at the tightening angle which is equivalent to the trip torque per tightening angle – trip torque diagram.
3. At first, tighten the adjustment nut at 60 degrees smaller than the required value and test. Then gradually increase the tripping torque to the best value.

Do not turn the adjustment nut over the maximum value of the torque indicator. Otherwise there is no margin of coil spring when tripping.

TP-20, 30, 50

1. Torque setting is adjusted by tightening or loosening the adjustment nut. Make sure that the setscrew in the nut is loosened to prevent hub thread damage. Note: There is a brass lock plug under setscrew.
2. Refer to catalog torque to determine approximate rotation of adjustment nut to obtain desired torque. It is suggested that the nut is first tightened to a value less than desired (60 degrees) and final adjusted on the shaft after making a test run.
3. Adjust to final torque by gradually tightening adjustment nut.
4. After setting torque, tighten setscrew to prevent loosening.
5. Note: Do not tighten the adjustment nut beyond maximum limit of scale because the TP unit may not trip even under overloading conditions.

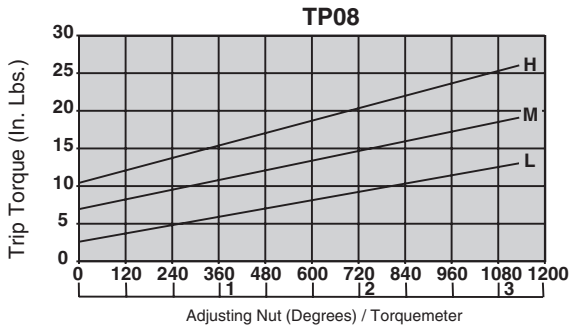

TP-70, 90, 110 and 130

1. Torque adjustment is accomplished by the three adjustment bolts. First, loosen the lock nuts on the adjustment bolts **and remove the lock plugs (TP 70 and 90 do not have lock plugs)**. Then, check that the match mark of the hub and adjustment plate line up and the setscrew is tight.
2. Refer to catalog torque to determine approximate rotation of the adjustment bolt to obtain desired torque. It is suggested that initially the bolt is tightened to a value less than desired (60 degrees) and final adjusted on the shaft after making a test run.
3. Adjust to final torque by gradually tightening the three adjusting bolts evenly.
4. Tighten the lock nuts to prevent the adjustment bolts from loosening.
5. Note: Do not tighten the adjusting bolts beyond the maximum limit of the scale because the TP unit may not trip even under overloading conditions.

Resetting

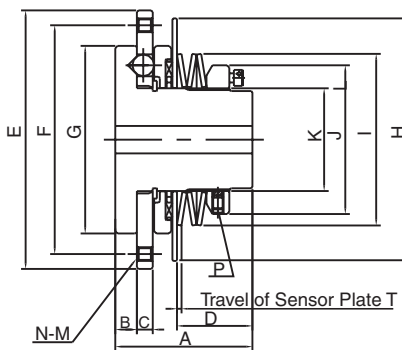

- a. When TP trips, stop the drive and remove the source of the overload.
- b. Reset by either rotating at 50 rpm or less or by jogging the motor.
- c. When resetting, an audible sound will be heard as the ball snaps into the detent.

Torque Settings

TP08 - TP16

TP20 - TP50

Installation and Maintenance

Reboring

1. TP Torq/Pro Hub:
 - A. Disassemble all parts from hub, being careful to keep clean and free of nicks and any damage.
 - B. Chuck on flange of hub and align as illustrated (Figure 1).
 - C. Rebore to desired size within catalog bore range.
2. Coupling Sprocket:
 - A. Chuck on sprocket hub, indicate for alignment, and rebore.
 - B. Do not exceed maximum bore.

Figure 1

Reassemble and Minimum Torque Setting

1. Reassemble:
 - A. Assemble parts in reverse order. Refer to cross section drawing.
 - B. Apply grease to balls and needle bearing.
 - C. Be careful to orient the springs as illustrated.
2. Reset to minimum torque:
 - A. This auto-resetting type only requires re-starting of the motor, etc. at the drive side for re-engagement. Remove the cause of overload after stopping the equipment when the Torq/Pro trips. Reset TP with input rotation of 50 rpm or slower or by inching of motor. Never reset manually. If you hear the “clicks”, the balls are back in the pocket holes.
 - B. TP 08, 12, 16, 20, 30, 50: Set the indicator to the “0” point on the sticker by tightening the adjustment nut.
 - C. TP 70, 90, 110, 130: Make sure that adjustment bolt and nuts are loose, lineup match mark on hub and adjustment plate. Then tighten the setscrews in the adjustment plate to lock position on the hub. For TP-110 and 130, tighten setscrew with lock plug. Tighten the three adjustment bolts equally to locate the indicator to the “0” point.

Mounting of the Drive Member

1. Drive member will pilot over center flange with a clearance fit.
2. Dimensions of drive member and mounting bolts are listed (Figure 2).

Figure 2

Model	A	B	C	D	N
TP20	2.50	3.00	3.502–3.505	7/32	4
TP30	3.38	3.94	4.439–4.442	9/32	6
TP50	4.94	5.50	6.252–6.255	11/32	6
TP70	6.75	7.88	8.627–8.630	13/32	6

Note: Dimension .125 changes to .200 if using #60 sprocket with TP30.

Mounting of TP on Shaft

Use of a parallel key is required. Tighten the setscrew to secure to the shaft. Use of lock-tite is suggested to prevent the setscrew from loosening.

Coupling

1. Alignment:
 - A. Angular misalignment should be held within 0.5 degrees. To indicate measure dimension “C” along outside edge of sprocket in at least three locations (Figure 3).
 - B. Parallel misalignment should be within limit “E” listed in table and measured with a straight edge and feeler gauges.
2. Wrap sprockets with chain to complete assembly.

Model	C	E
TP20	.291	.009

Figure 3

Maintenance

1. Disassemble unit and apply grease on the ball and bearing once a year or 1000 trips.
2. Use NGLI 2 lithium based EP grease.

Overload Detection

With use of a proximity switch the operating system can be shut down. Whenever the TP unit trips due to an overload, the sensor plate will move a sufficient amount. Use an Omron® switch number EZE-X1R5YZ or equivalent.

Omron is believed to be a trademark and/or a trade name of Omron Electronics LLC and is not owned or controlled by Emerson Power Transmission Corporation. This trademark and/or registered trademark of others is used herein for product comparison purposes only, is the property of their respective owners and is not owned or controlled by Emerson Power Transmission Corporation. While reasonable efforts have been made to confirm ownership of the marks and names listed above, Emerson Power Transmission Corporation cannot and does not represent or warrant the accuracy of this information.

Design Features

For the Protection of Servo Drives and High-Speed Response Drive Systems

With the advent of new industrial automation technologies, higher levels of precision are being introduced in the positioning and indexing of all types of machinery and systems, especially servomotors.

Operating errors in high tech mechanical systems can cause damage and accidents, resulting in considerable loss of time and money. The TPX high precision torque overload device satisfies the demand for precision and functionality in these types of machines and systems. This series provides drive disengagement when overload occurs and also includes features such as backlash prevention, high rigidity and easy adjustment by means of a torque scale.

Industries Served

- Automotive
- Food and beverage
- Steel
- Textiles

Field Applications

- Conveyors
- Food and beverage equipment
- Machine tools
- Mixers
- Packaging equipment
- Textile machinery
- X-ray machinery

Features

Backlash – Patent pending, innovative ball and wedge mechanism nearly eliminates backlash.

High precision tripping – Little motion lost during tripping. Reoccurrence of trip torque (dispersion rate) is held within $\pm 3\%$.

Coupling capability – In the coupling model, misalignment of $0.5^\circ - 1^\circ$ due to angling error, parallelism or displacement of axis direction, is compensated for by the ball and wedge mechanism.

One position – Ball and pocket are uniquely designed to fit together in only one position, which allows the system reset to be kept in place.

Easy torque adjustment – Adjust trip torque by simply turning the adjustment nut.

Verification of torque setting – Torque setting can be easily verified by checking the torque scale and indicator.

Browning Torq/Pro TPX is a release-type ball-detent torque overload device with a single position reset configuration and offers:

- Improved accuracy
- Simple design
- Reversible
- Torque set scale
- Switch detector plate

Torque Overload Devices

Selection Guide

Install the TPX as close as possible to the location where overload is likely to occur.

Selecting Trip Torque - TPX only

Set trip torque equal to the maximum amount of torque that can be applied, based on conditions such as the strength of the machine and load. When the maximum amount of torque is unclear, calculate the rated torque from the rated output and rpm of the shaft onto which the torque overload device is to be installed and multiply this figure by the service factor. The result may be taken as the trip torque.

$$T = \frac{974 \times P}{N} \times S.F.$$

T = trip torque (kgf-m)
 P = rated output (kW)
 N = revolutions per minute (rpm)
 S.F. = service factor

1. Verification of shaft bore diameter and rpm
2. Model number selection

Determination of Service Factor

S.F.	Operating Conditions
1.25	Normal starting and stopping, intermittent motion
1.50	Load with severe shocks, forward and reverse motion

Setting Trip Torque

1. The torque of all TPX torque overload devices is set at the minimum value when shipped. Please check to make sure that the indicator is pointing to zero on the torque scale.
2. Loosen the fit-drive set screw of the adjustment nut and remove the lock plug.
3. Look at the tightening-torque graph below to determine the angle to which the adjustment nut must be tightened to produce the trip torque determined above. The torque scale is divided into increments of 60°. First turn the adjustment nut to an angle of 60° before the angle determined from the graph, install the TPX onto the machine, and do a trip test. Then gradually tighten the nut until the required torque is reached.
4. After the torque is set, insert the lock plug and tighten the screw with hole so that it holds loosely.
5. Do not turn the adjustment nut beyond the largest value on the torque scale. If this is done, the coiled spring will not have sufficient flexible leeway and the guard will lock when tripping occurs.

Resetting

1. The guard automatically resets when the motor or drive is restarted.
2. When tripping occurs, stop the machine and remove the cause of the overload.
3. When restarting the motor to reset the TPX, keep the revolution speed low and increase it gradually. It is very dangerous to use your hands, so keep them away from the torque overload device. When it resets it will make a "clicking" sound.

Torque Correlation

Design Features

Direct Attachment Offers Greater Protection

Browning TPZ torque overload device allows the input side to continue to revolve freely after tripping. The TPZ includes an ON-OFF clutch capability for starting and stopping rotary transmissions. It may be used as a clutch to stop rotary transmissions when applying, disconnecting or adjusting required torque needs.

Industries Served

- Material handling
- Food and beverage
- Packaging

Field Applications

- Binding machinery
- Food and beverage equipment
- Machine tools
- Packaging equipment

Features

Release type – after tripping due to overload, the input side continues to revolve freely.

External force resetting – after the machine has been stopped and the source of overload has been removed, the TPZ is reset by applying a load in the direction of the shaft, either manually or by means of external force.

ON-OFF clutch capability – shaft revolution can be started or stopped at will. It can be used as a mechanical ON-OFF clutch.

Single position reset – the ball and pocket act as the torque transmission element and are uniquely designed to fit together in only one position.

Torque tripping precision – precision is within $\pm 10\%$ – even with repeated tripping, precision remains within $\pm 10\%$.

Easy torque adjustment – trip torque is adjusted by simply turning the adjustment nut.

Easy-to-read torque scale – torque setting may be easily verified using the rpm and angle scales.

Maintenance

Lubrication intervals depend upon the type of application, speed, temperature and other external conditions. For general use, apply a thin layer of EP grease to the ball and bearing section every year or after every 1000 trips. Experience will determine the best interval for each specific application.

Selection Guide

Install the TPZ as close as possible to the location in which overload is likely to occur.

Selecting the Trip Torque

1. Set the trip torque equal to the maximum amount of torque that can be applied, based on conditions such as the strength of the machine and load. When the maximum amount of torque is unclear, calculate the rated torque from the rated output and rpm of the shaft onto which the torque overload device is to be installed and multiply this figure by the service factor. The result may be taken as the trip torque.

$$T = \frac{974 \times P}{N} \times S.F.$$

T = trip torque (kgf-m)
 P = rated output (kW)
 N = revolutions per minute (rpm)
 S.F. = service factor

2. Verification of shaft bore diameter and rpm.
3. Model number selection.

Determination of Service Factor

S.F.	Operating Conditions
1.25	Normal starting and stopping, intermittent motion
1.50	Load with severe shocks, forward and reverse motion

Shaft Bore Machining

1. Before machining – the torque of each TPZ torque overload device is set to the minimum value when shipped. Please verify that the rpm and angle scales both read zero.
2. Disassembly – loosen the setscrew and remove the coiled spring. Disassemble the coiled spring, plate and ball, etc. Remove the stop ring and take out the bearings and driven flange. Take care at this time that no dust or dirt accumulates.
3. Chucking – secure the exterior diameter of the hub flange in a chuck and center at the boss.
4. Machining – machine the keyway directly under the setscrew tap on the hub flange.
5. Assembly – when reassembling the parts after machining the shaft bore, grease balls A and B, the pockets and V groove.

Setting Trip Torque

1. The torque of all TPZ torque overload devices is set at the minimum value when shipped. Check to make sure that the indicator is pointing to zero on the torque scale.
2. Loosen the fit-drive set screw of the adjustment nut and remove the lock plug.
3. Look at the tightening-torque graph below to determine the angle to which the adjustment nut must be tightened to produce the trip torque determined above. The torque scale is divided into increments of 60°. First turn the adjustment nut to an angle of 60° before the angle determined from the graph. Install the TPX onto the machine and do a trip test. Then gradually tighten the nut until reaching the required torque.
4. After the torque is set, insert the lock plug and tighten the screw with hole so that it holds loosely.
5. Do not turn the adjustment nut beyond the largest value on the torque scale. If this is done, the coiled spring will not have sufficient flexible leeway and the guard will lock when tripping occurs.

A uniquely simple design concept... ruggedly executed. Provides maximum reliability.

Features

- Modular design – one unit for direct drive, chain drive or other power transmission options
- Universal mounting: eliminates special bore requirements
- Automatic reset
- Single position reset
- Reversible
- Torque repeatability

Torq/Gard Torque Overload Devices - Built Tough so You Can Depend on It!

Torq/Gard overload clutches help protect the entire drive train of your machinery from damage due to excessive torque generated by overloads and jamming. Instant reaction when torque exceeds preset limits provides protection far superior to that of clutches employing friction surfaces.

Unlike friction clutches, the Torq/Gard torque overload device is not subject to torque variations caused by lubricants, heat and water. This unique design maintains precise torque control as it is not subject to significant wear or thermal variations resulting from repeated engagement and disengagement of the unit.

Torq/Gard clutches are more precise than shear pins, easier to reset and are not susceptible to fatigue failures.

Torq/Gard clutches disengage at the precise torque limit you set – every time. And when the overload condition has been corrected, Torq/Gard torque overload devices are automatically reset by “jogging” the machine. Automatic reset minimizes downtime, eliminates manual reset, and permits application in inaccessible locations.

Thermal overload devices, used with electric motors, provide no defense against inertia loads. Their slow reaction time offer little protection to sudden peak torque loads. Torq/Gard clutches give dependable instantaneous response to your overload protection needs every time!

Industries Served

- Food and beverage
- Aggregate processing
- Conveyor manufacturing
- Agriculture

Applications

- Sorting and filling machinery
- Conveyors
- Wrapping and cartoning equipment
- Industrial equipment
- Agricultural equipment

Shaft Bushings

Ever-Flex® Couplings

Chain Drives

Detectors

Chain Couplings

Only Torq/Gard Has All These Standard Features.

Single-Position and Reversible

A spring-loaded cam follower seated in a single hub cam detent causes hub and clutch body to rotate together: thus the clutch always resets in the same position if tripped. Since the cam detent profile is the same in both positions, all Torq/Gard clutches are fully reversible.

Automatic Reset

The Torq/Gard clutch is quickly reset after a jam is cleared by simply jogging the machine until the cam follower reengages the hub cam detent. This avoids potentially dangerous manual resetting and requires no tools.

Bushings Permit a Wide Range of Shaft Sizes

To allow you to use an off-the-shelf Torq/Gard clutch on shafts of various sizes, the clutch was designed with a larger than usual hub bore. Shafts smaller than the maximum diameter are accommodated with standard Browning bushing kits.

Registered Mounting Lugs

All Torq/Gard clutches are designed with tapped mounting lugs to accommodate Browning single strand chain sprockets or gearbelt pulleys - without modification.

Chain Coupling Drive Options

Browning chain coupling kits mount directly on the Torq/Gard clutch. Hubs with split taper bushings simplify drive applications.

Universal Adapter Plate

A universal adapter plate is available for direct mounting of Browning Ever-Flex couplings to the Torq/Gard. The plate may also be modified for special transmission options.

Detector Plate Assembly

The detector mechanism actuates a limit switch, which disconnects the motor from the power source when the Torq/Gard is disengaged. To reset the clutch, simply jog the machine by pressing the motor "start" button. A typical wiring diagram is provided with each Torq/Gard clutch. Detector plates are standard on all sizes. Limit switches are not supplied.

Infinitely Adjustable Within Load Range

Turning a single, hex-socket head control adjusts the Torq/Gard clutch precisely to any setting within its load range. Index marks on the clutch body give approximate settings to facilitate adjustment.

One basic design fits most installations.

Direct drive application with the Torq/Gard mounted on the low speed output shaft of the reducer. The Torq/Gard is shown with a Browning Ever-Flex half coupling, which mounts on the clutch adapter without modification. Browning chain coupling kits are also available for the Torq/Gard when greater misalignment capabilities are required. Either side of the Torq/Gard can be used as the input.

The Torq/Gard should not be used on the high-speed input side of the reducer. Clutch sensitivity becomes a function of the reducer's gear ratio. As an example, when used with a 100 to 1 reducer, a 100 inch-pound torque variation on the output side will reflect only a 1 inch-pound change on the input side. Do not exceed the maximum rpm shown in the Torq/Gard selection table.

Mounting the clutch on the output of the gear motor or reducer provides the most economical clutch assembly. The Torq/Gard is designed to protect the weakest link in the drive system.

The Torq/Gard is mounted on the driven machine and is powered through a chain and sprocket drive. Mounting the clutch in this position tends to absorb peak starting torques.

Selecting the Right Torq/Gard Clutch - Easy as 1 - 2 - 3

1. Torq/Gard clutches may be sized by the speed/torque chart.

Tripping torque should be at least 25% greater than the operating torque to compensate for motor starting torque, intermittent loads, shock loads and reversing loads.

The speed/torque chart incorporates this 25% service factor (S.F.). On shock load or reversing load applications service factor greater than 25% may be required.

2. The Torq/Gard may also be sized by applying one of the following formulas.

$$\text{Torque (in.-lbs)} = \frac{\text{Horsepower (HP)} \times 63025}{\text{rpm}}$$

$$\text{Horsepower} = \frac{\text{Torque (in.-lbs.)} \times \text{rpm}}{63025}$$

$$\text{Tripping Torque} = \text{Operating Torque} \times \text{S.F.}$$

3. Select the desired Torq/Gard from the rating chart.

The Torq/Gard will successfully operate from 0 speed to the maximum rpm listed.

rpm	Horsepower

Browning Axial Gard TPA

The Browning Axial Gard is suitable for overload of axial direction such as pusher or crank motion and is directly mounted to the shaft to protect the machine from damage due to unexpected stopping. The Browning Axial Gard is designed for easy trip setting and will always reset.

Field Applications

- Automatic machinery
- Machine tools
- Medical treatment machinery
- Packaging equipment
- Special purpose machinery
- Testing machinery

Principle

A. Thrust load from case (slide shaft) leads to slide shaft (case) through steel ball.

B. When thrust load exceeds the setting load, steel ball pops out of groove and slide shaft becomes free.

Features and Benefits

- High accuracy: $\pm 15\%$ trip load
- Easy trip setting: trip load is easily set by rotating the adjustment screw. Trip loads in either direction are the same.
- Release type: Axial Gard trips immediately after overload occurs. The device cuts off axial load from the drive shaft to the driven shaft. The Axial Gard is easily reset, which allows the machine to recover quickly.

Model	Trip Load Setting Range (N)		Dimensions (mm)										
			A Case Diameter	B Bolt Circle	C Diameter	D Shaft Diameter	E Diameter	F	G	H Shoulder	I	J Counter Bore Depth	K

For selection assistance, call Application Engineering at 1-800-626-2093 or visit www.emerson-ept.com

Axial Gard Selection Guide

1. Install Axial Gard at the nearest place where overload may occur.
2. To decide setting load, set maximum setting load after you consider normal necessary load or machine strength. If maximum setting load is unknown, set lower load at first and increase setting load gradually.

How to set setting load

3. Axial Gard is setting at min point (minimum load) when shipped.
4. Loosen setscrew for adjustment screw.
5. Fasten adjustment screw at 60 degrees before the target position according to load correlation graph.
6. Fasten adjustment screw gradually after testing trip.
7. Fasten setscrew for adjustment screw.
8. Don't fasten adjustment screw over maximum load shown in correlation graph.

Resetting

9. Remove the cause of overload after stopping machine.
10. Axial Gard will be reset automatically when you slowly give it opposite load.
11. Check to ensure Axial Gard was reset by checking dimension A.

Model	Resetting Load (N)	A mm
TPA65	83 N	11
TPA150	196 N	19
TPA250	343 N	22
TPA350	490 N	24

At maximum load

Installation

1. Before installing into the machine, clean the tap holes on the "case" and "slide shaft" and remove dust caps or tips.
2. Adhesive for metal is applied to the screws of "slide shaft" and "case" for preventing looseness.
3. Be careful to align the center of the "case" and "slide shaft".
4. Axial Gard is shipped after applying the grease but apply grease once a year or every 100 times tripping.

See page 121 for load correlation graph.

HP and Torque

HP is the common unit of mechanical power.

$$HP = \frac{\text{Force} \times \text{Feet per Minute}}{33000}$$

$$HP = \frac{\text{Torque in In.-Lbs.} \times \text{rpm}}{63025}$$

One HP = .746 kilowatt

One kilowatt = 1.34 HP

Torque is a twisting moment or turning effort.

Torque in inch-pounds = Force x Lever Arm (Inches)

$$\text{Torque in inch-pounds} = \frac{63025 \times HP}{\text{rpm}}$$

The following table gives the torque in Inch-Pounds for one HP at various speeds.

Torque at One HP

rpm	In.-Lbs.	rpm	In.-Lbs.	rpm	In.-Lbs.	rpm	In.-Lbs.
3500	18	580	109	90	700	14	4502

To obtain the minimum pitch diameters for flat belt, gearbelt, Poly-V®, chain or gear drives, multiply the 358 sheave pitch diameters in the table above by the following factors:

Drive	Factor
Chain	0.70
Flat Belt (Single Ply)	1.33
Gearbelt	0.90
Helical Gear	0.85
Poly-V	1.00
Spur Gear	0.75

Poly-V is believed to be a trademark and/or a trade name of Goodyear Tire and Rubber Co. and is not owned or controlled by Emerson Power Transmission Corporation. This trademark and/or registered trademark of others is used herein for product comparison purposes only, is the property of their respective owners and is not owned or controlled by Emerson Power Transmission Corporation. Morse[®]

Mechanical Clutches

The industry's broadest line of conveyor backstop, overrunning and indexing clutches.

Morse mechanical clutches offer the most complete and versatile selection in the industry. Eleven series of clutches perform three basic modes of operation:

- Overrunning
- Indexing
- Backstopping

These units have set standards of performance, offering:

- Higher overrunning speeds
- Greater torque capacities
- Longer service life

Cam clutches are precision devices that lock the inner and outer races through the wedging action of cams to transmit torque in one direction of rotation while overrunning in the opposite direction of rotation. These units are often referred to as freewheels, sprag, overrunning, backstop or one-way clutches, depending upon their application.

Protect your equipment with Morse and Browning Torque Overload Devices.

Browning and Morse torque overload devices are designed to protect machinery when an overload or jam occurs. Utilizing a torque overload device can help increase production, reduce downtime and prevent costly repairs. Emerson Power Transmission offers eight different types of torque overload devices available in shear pin, ball detent and friction facing designs. These units are available with up to 1800 rpm, 21,500 ft/lbs of torque and at best, can maintain trip torque within $\pm 3\%$ accuracy to meet the needs of the most demanding applications.

Custom Design

The Morse line of clutches covers a wide range of sizes and capacities, which handle the majority of industrial applications. However, there are applications that require special designs to meet specific application needs.

Emerson Power Transmission offers engineering assistance in both design and application to help meet these specialized requirements.

For selection assistance, call Application Engineering at 1-800-626-2093 or fax the completed form on page 76 to:

Morse mechanical cam clutches are precision devices that lock the inner and outer races through the wedging action of cams to transmit torque in one direction of rotation while overrunning in the opposite direction of rotation. These type units are often referred to as freewheels, sprag, overrunning, backstop or one-way clutches, depending upon their application.

Clutches are available with a bore range up through 17.7" and a torque range up through 500,000 lb. ft. and are the most complete and versatile cam clutches available for a variety of applications – from small business machines to giant steel slitters.

Eleven series of clutches perform three basic modes of operation:

- Overrunning
- Indexing
- Backstopping

These units have set standards of performance, offering:

- Higher overrunning speeds
- Greater torque capacities
- Longer service life

All sales are made on our STANDARD TERMS AND CONDITIONS OF SALE in effect at the time a customer's order is accepted. The current Terms and Conditions are set forth below:

STANDARD TERMS AND CONDITIONS OF SALE (August 15, 2001)

These Terms and Conditions, the attendant quotation or acknowledgment and all documents incorporated by specific reference therein, will be the complete and exclusive statement of the terms of the agreement governing the sale of goods ("Goods") by Emerson Power Transmission Corporation and its divisions and subsidiaries ("Seller") to Customer ("Buyer"). Buyer's acceptance of the Goods will manifest Buyer's assent to these Terms and Conditions. If these Terms and Conditions differ in any way from the terms and conditions of Buyer's order, or other documentation, this document will be construed as a counteroffer and will not be deemed an acceptance of Buyer's terms and conditions which conflict herewith.

1. **PRICES:** Unless otherwise specified in writing by Seller, Seller's price for the goods shall remain in effect for thirty (30) days after the date of Seller's quotation or acknowledgment of Buyer's order for the Goods, whichever occurs first, provided an unconditional, complete authorization for the immediate shipment of the Goods is received and accepted by Seller within such time period. If such authorization is not received by Seller within such thirty (30) day period, Seller shall have the right to change the price for the Good to Seller's price for the Goods at the time of shipment.

2. **TAXES:** Any tax or governmental charge or increase in same hereafter becoming effective increasing the cost to Seller of producing, selling or delivering the Goods or of procuring material used therein, and any tax now in effect or increase in same payable by the Seller because of the manufacture, sale or delivery of the Goods, may at Seller's option, be added to the price.

3. **TERMS OF PAYMENT:** Subject to the approval of Seller's Credit Department, terms are net thirty (30) days from date of Seller's invoice in U.S. currency. If any payment owed to Seller is not paid when due, it shall bear interest, at a rate to be determined by Seller, which shall not exceed the maximum rate permitted by law, from the date on which it is due until it is paid. Seller shall have the right, among other remedies, either to terminate the Agreement or to suspend further performance under this and/or other agreements with Buyer in the event Buyer fails to make any payment when due. Buyer shall be liable for all expenses, including attorneys' fees, relating to the collection of past due amounts.

4. **SHIPMENT AND DELIVERY:** Shipments are made F.O.B. Seller's shipping point. Any claims for shortages or damages suffered in transit shall be submitted by the Buyer directly to the carrier. While Seller will use all reasonable commercial efforts to maintain the delivery date acknowledged or quoted by Seller, all shipping dates are approximate. Seller reserves the right to make partial shipments and to segregate "specials" and made-to-order Goods from normal stock Goods. Seller shall not be bound to tender delivery of any Goods for which Buyer has not provided shipping instructions.

5. **QUANTITY:** Buyer agrees to accept overruns of up to ten percent (10%) of the order on "made-to-order" Goods, including parts. Any such additional items shall be priced at the price per item charged for the specific quantity ordered.

6. **LIMITED WARRANTY:** Subject to the limitations of Section 7, Seller warrants that the Goods will be free from defects in material and workmanship under normal use, service and maintenance for a period of one year (unless otherwise specified by Seller in writing) from the date of shipment of the Goods by Seller. **THIS IS THE SOLE AND EXCLUSIVE WARRANTY GIVEN BY SELLER WITH RESPECT TO THE GOODS AND IS IN LIEU OF AND EXCLUDES ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, ARISING BY OPERATION OF LAW OR OTHERWISE, INCLUDING WITHOUT LIMITATION, MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE WHETHER OR NOT THE PURPOSE OR USE HAS BEEN DISCLOSED TO SELLER IN SPECIFICATIONS, DRAWINGS OR OTHERWISE, AND WHETHER OR NOT SELLER'S PRODUCTS ARE SPECIFICALLY DESIGNED AND/OR MANUFACTURED BY SELLER FOR BUYER'S USE OR PURPOSE.**

This warranty does not extend to any losses or damages due to misuse, accident, abuse, neglect, normal wear and tear, unauthorized modification or alteration, use beyond rated capacity, or improper installation, maintenance or application. To the extent that Buyer or its agents has supplied specifications, information, representation of operating conditions or other data to Seller in the selection or design of the Goods and the preparation of Seller's quotation, and in the event that actual operating conditions or other conditions differ from those represented by Buyer, any warranties or other provisions contained herein which are affected by such conditions shall be null and void. If within thirty (30) days after Buyer's discovery of any warranty defects within the warranty period, Buyer notifies Seller thereof in writing, Seller shall, at its option, repair or replace F.O.B. point of manufacture, or refund the purchase price for, that portion of the goods found by Seller to be defective. Failure by Buyer to give such written notice within the applicable time period shall be deemed an absolute and unconditional waiver of Buyer's claim for such defects. Goods repaired or replaced during the warranty period shall be covered by the foregoing warranty for the remainder of the original warranty period or ninety (90) days, whichever is longer. Buyer assumes all other responsibility for any loss, damage, or injury to persons or property arising out of, connected with, or resulting from the use of Goods, either alone or in combination with other products/components.

SECTIONS 6 AND 7 APPLY TO ANY ENTITY OR PERSON WHO MAY BUY, ACQUIRE OR USE SELLER'S GOODS, INCLUDING ANY ENTITY OR PERSON WHO BUYS THE GOODS FROM SELLER'S DISTRIBUTOR AND SUCH ENTITY OR PERSON SHALL BE BOUND BY THE LIMITATIONS THEREIN.

7. **LIMITATION OF REMEDY AND LIABILITY: THE SOLE AND EXCLUSIVE REMEDY FOR BREACH OF ANY WARRANTY HEREUNDER (OTHER THAN THE WARRANTY PROVIDED UNDER SECTION 13) SHALL BE LIMITED TO REPAIR, REPLACEMENT OR REFUND OF THE PURCHASE PRICE UNDER SECTION 6. SELLER SHALL NOT BE LIABLE FOR DAMAGES CAUSED BY DELAY IN PERFORMANCE AND IN NO EVENT, REGARDLESS OF THE FORM OF THE CLAIM OR CAUSE OF ACTION (WHETHER BASED IN CONTRACT, INFRINGEMENT, NEGLIGENCE, STRICT LIABILITY, OTHER TORT OR OTHERWISE), SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXCEED THE PRICE TO BUYER OF THE SPECIFIC GOODS PROVIDED BY SELLER GIVING RISE TO THE CLAIM OR CAUSE OF ACTION. BUYER AGREES THAT IN NO EVENT SHALL SELLER'S LIABILITY TO BUYER AND/OR ITS CUSTOMERS EXTEND TO INCLUDE INCIDENTAL, CONSEQUENTIAL OR PUNITIVE DAMAGES. THE TERM "CONSEQUENTIAL DAMAGES" SHALL INCLUDE, BUT NOT BE LIMITED TO, LOSS OF ANTICIPATED PROFITS, LOSS OF USE, LOSS OF REVENUE, COST OF CAPITAL AND DAMAGE OR LOSS OF OTHER PROPERTY OR EQUIPMENT.**

It is expressly understood that any technical advice furnished by Seller with respect to the use of the Goods is given without charge, and Seller assumes no obligation or liability for the advice given, or results obtained, all such advice being given and accepted at Buyer's risk.

GOODS AND/OR SERVICES SOLD HEREUNDER ARE NOT FOR USE IN ANY NUCLEAR AND RELATED APPLICATIONS. Buyer accepts goods and/or services with the foregoing understanding, agrees to communicate the same in writing to any subsequent purchaser or users and to defend, indemnify and hold harmless Seller from any claims, losses, suits, judgments and damages, including incidental and consequential damages, arising from such use, whether the cause of action be based in tort, contract or otherwise, including allegations that the Seller's liability is based on negligence or strict liability.

8. **EXCUSE OF PERFORMANCE:** Seller shall not be liable for delays in performance or for non-performance due to acts of God, acts of Buyer, war, riot, fire, flood, other severe weather, sabotage, or epidemics; strikes or labor disturbances; governmental requests, restrictions, laws, regulations, orders or actions; unavailability of or delays in transportation; default of suppliers; or unforeseen circumstances or any events or causes beyond Seller's reasonable control. Deliveries may be suspended for an appropriate period of time as a result of the foregoing. If Seller determines that its ability to supply the total demand for the Goods, or to obtain material used directly or indirectly in the manufacture of the Goods, is hindered, limited or made impracticable due to causes addressed in this Section 8, Seller may allocate its available supply of the Goods or such material (without obligation to acquire other supplies of any such Goods or material) among itself and its purchasers on such basis as Seller determines to be equitable without liability for any failure of performance which may result therefrom. Deliveries suspended or not made by reason of this section may be canceled by Seller upon notice to Buyer without liability, but the balance of the agreement shall otherwise remain unaffected.

9. **CANCELLATION:** The Buyer may cancel orders only upon written notice and upon payment to Seller of cancellation charges which include, among other things, all costs and expenses incurred and commitments made by the Seller and a reasonable profit thereon.

10. **CHANGES:** Buyer may request changes or additions to the Goods consistent with Seller's specifications and criteria. In the event such changes or additions are accepted by Seller, Seller may revise the price and delivery schedule. Seller reserves the right to change designs and specifications for the Goods without prior notice to Buyer, except with respect to Goods being made-to-order for Buyer.

11. **TOOLING:** Tool, die, and pattern charges, if any, are in addition to the price of the Goods and are due and payable upon completion of the tooling. All such tools, dies and patterns shall be and remain the property of Seller. Charges for tools, dies, and patterns do not convey to Buyer, title, ownership interests in, or rights to possession or removal, nor prevent their use by Seller for other purchasers, except as otherwise expressly provided by Seller and Buyer in writing with reference to this provision.

12. **ASSIGNMENT:** Buyer shall not assign its rights or delegate its duties hereunder or any interest therein or any rights hereunder without the prior written consent of the Seller, and any such assignment, without such consent, shall be void.

13. **PATENTS AND COPYRIGHTS:** Subject to Section 7, Seller warrants that the Goods sold, except as are made specifically for Buyer according to Buyer's specifications, do not infringe any valid U.S. patent or copyright in existence as of the date of delivery. This warranty is given upon the condition that Buyer promptly notify Seller of any claim or suit involving Buyer in which such infringement is alleged, and that Buyer cooperate fully with Seller and permit Seller to control completely the defense or compromise of any such allegation of infringement. Seller's warranty as to use only applies to infringements arising solely out of the inherent operation (i) of such Goods, or (ii) of any combination of Goods in a system designed by Seller. In the event such Goods, singularly or in combination, are held to infringe a U.S. patent or copyright in such suit, and the use of such Goods is enjoined, or in the case of a compromise by Seller, Seller shall have the right, at its option and expense, to procure for Buyer the right to continue using such Goods, or replace them with non-infringing Goods; or modify same to become non-infringing; or grant Buyer a credit for the depreciated value of such Goods and accept return of them.

14. **MISCELLANEOUS:** These terms and conditions set forth the entire understanding and agreement between Seller and Buyer, and supersede all other communications, negotiations and prior oral or written statements regarding the subject matter of these terms and conditions. No change, modification, rescission, discharge, abandonment, or waiver of these terms and conditions of Sale shall be binding upon the Seller unless made in writing and signed on its behalf by an officer of the Seller. No conditions, usage or trade, course of dealing or performance, understanding or agreement purporting to modify, vary, explain, or supplement these Terms and Conditions shall be binding unless hereafter made in writing and signed by the party to be bound, and no modification shall be affected by the acceptance of purchase orders or shipping instruction forms containing terms at variance with or in addition to those set forth herein. Any such modifications or additional terms are specifically rejected by Seller. No waiver by Seller with respect to any breach or default or any right or remedy and no course of dealing, shall be deemed to constitute a continuing waiver of any other breach or default or of any other right or remedy, unless such waiver be expressed in writing and signed by the party to be bound. Seller is not responsible for typographical or clerical errors made in any quotation, orders or publications. All such errors are subject to correction. The validity, performance, and all other matters relating to the interpretation and effect of this contract shall be governed by the law of the state of New York. The United Nations Convention on the International Sale of Goods shall not apply to any transaction hereunder.
