Why Interface?

- **WE ARE #1 . . . THE WORLD LEADER IN HIGH ACCURACY LOAD CELLS FOR FORCE MEASUREMENT**

- + Performance guarantee: Our load cells will outperform our competition's load cells—**PERIOD!**
- + Our Gold Standard™ Calibration System is just that—the gold standard, the only comprehensive system available that allows companies to calibrate their load cells. (How do you think many calibration labs and even some of our competitors calibrate **their** load cells?)
- + Every cell we make is individually tested and calibrated (no sampling).
- + Temperature characteristics are tested at both low and high temperature.
- + Self-temperature compensating strain gages manufactured from proprietary alloy.
- + Cells are creep tested to the tightest specification in the industry.
- + World's largest producer of low profile load cells. Each uses 8 gages to assure highest accuracy and each is moment compensated to minimize sensitivity to extraneous loads.
- + Higher output (up to 4mV/V output on low profile load cells).
- + Our vertical integration means shorter lead times, better quality control and lower costs. Many of our competitors farm out their CNC work, for example, but **our** machining is programmed directly from the same software used to design the load cell.
- + CATALOG ITEMS: Most load cells in our catalog are stocked for immediate shipment.
- + CUSTOM LOAD CELLS: **We will work with you to provide precisely what you need . . . quickly and cost-effectively.**

- **INDUSTRY LEADERSHIP CARRIES A RESPONSIBILITY FOR SERVICE LEADERSHIP.**

You don't have to be an expert in force measurement...because **we are**. Talk to us about what sort of forces or torques you need to measure, and under what conditions and constraints. We'll walk you through the load cell specification process...quickly and efficiently.

- **WHEN ACCURACY IS IMPORTANT, BEWARE OF COPYCAT PRODUCTS THAT DO NOT MEASURE UP . . . LITERALLY.**

We're proud of our innovation. Our load cells are 100% US-designed and manufactured, and Interface is 100% US-owned. But the real answer to the question, "Why Interface?" is the quality and accuracy of the products themselves.

180 ..APPENDIX

LOW PROFILE™ GENERAL PURPOSE AND CALIBRATION LOAD CELLS

1000 Fatigue Rated

See page 10

- Capacities from 250 lbf to 100K lbf
- Metric capacities from 1.25 kN to 450 kN
- For fully reversed high cycle

1100 Ultra Precision

See page 14

- Capacities from 300 lbf to 200K lbf
- Metric capacities from 1.5 kN to 900 kN
- Highest accuracy

1200 Standard

See page 18

- Capacities from 300 lbf to 2000K lbf
- Metric capacities from 1.5 kN to 900 kN
- Eccentric load compensated

1200 Flange

See page 28

- Capacities from 30K lbf to 330K lbf
- Metric capacities from 140 kN to 1500 kN
- Eccentric load compensated

1700 Flange

See page 27

- Capacities from 550 lbf to 14K lbf
- Metric capacities from 10 kN to 20 kN
- Mounts directly to flange cylinders

1500 Standard Low Capacity

See page 32

- Capacities from 25 to 300 lbf
- Metric capacities from 125 to 1500 N
- Very good for eccentric loads

2400 Standard Stainless Steel

See page 44+

- Capacities from 100 lbf to 20K lbf
- Metric capacities from 450 N to 90 kN
- Welded diaphragm/connector

3200 Standard Stainless Steel

See page 50

- Capacities from 2.5K lbf to 100K lbf
- Metric capacities from 22 kN to 450 kN
- Eccentric load compensated

Interface Amplified Load Cells

See page's 24,48

- Capacities from 300 lbf to 2000K lbf
- Available in 2 or 3 wire configurations
- Eliminates need for external signal conditioning

See pg. 148 for additional info.

1600 Gold Standard™ Calibration

See page 34+

- Capacities from 500 lbf to 100K
- Metric capacities from 2.2 kN to 450 kN
- Guaranteed to 4% lower load limit

1606 Gold Standard™ Low Capacity Calibration

See page 38

- Capacities from 50 to 300 lbf
- Metric capacities from 250N to 1,500N
- Tension & compression in one unit

1800 Platinum Standard™ Calibration

See page 40

- Capacities from 1.1K to 55K lbf
- Metric capacities from 5 kN to 250 kN
- Integral adapter

COLUMN/ROD END LOAD CELLS

WMC Rod End

See page 64

- Capacities from 20K lbf to 50K lbf
- Stainless steel
- Tension & compression

REC Rod End

See page 65

- Capacities from 1K lbf to 25K lbf
- Metric capacities from 5 kN to 100 kN
- Environmentally sealed

2100 High Capacity Column

See page 79

- Capacities to 1000K lbf
- Metric capacities to 4450 kN
- Universal or compression-only

MINIATURE

SM S-Type

See page **56**

- Capacities from 10 lbf to 1K lbf
- Metric capacities from 50 N to 5 kN
- High accuracy “S” type cell

SSM Sealed S-Type

See page **57**

- Capacities from 50 lbf to 5K lbf
- Metric capacities from 200 N to 20 kN
- Sealed “S” type cell

SMT S-Type Overload Protected

See page **59**

- Capacities from 1.1 lbf to 450 lbf
- Metric capacities from 5 N to 2 kN
- Safe overload to 10X capacity

SMA Miniature S-Type

See page **60**

- Capacities from 15 lbf to 200 lbf
- Compact design
- Tension & compression

ULC Ultra Low Capacity

See page **58**

- Capacities from 2 oz to 7 oz
- Metric capacities from 0.5 N to 2 N
- Safe overload to 10X capacity

SML Low Height

See page **61**

- Capacities from 5 lbf to 1K lbf
- Metric capacities from 20 N to 4.5 kN
- Only 3/4" high

WMC Miniature Sealed Stainless Steel

See page's **62+**

- Capacities from 5 lbf to 10K lbf
- Stainless steel
- Tension & compression

LBM Compression

See page **66**

- Capacities from 25 lbf to 50K lbf
- Metric capacities from 110 N to 225 kN
- Low height

LBS Miniature Compression

See page **67**

- Capacities from 5 lbf to 1K lbf
- Metric capacities from 20 N to 4.5 kN
- Small diameter/low height

MSC Small Diameter High Capacity

See page **68**

- Capacities from 15K lbf to 30K lbf
- Compact design
- Stainless steel

LW Load Washer

See page **70**

- Capacities from 5 lbf to 100K lbf
- Metric capacities from 22 N to 450 kN
- Thru hole design

MB Miniature Beam

See page **72**

- Capacities from 5 lbf to 250 lbf
- Metric capacities from 20 N to 1.1 kN
- High accuracy beam type cell

MBP Miniature Beam Overload Protected

See page **73**

- Capacities from 2.5 lbf to 10 lbf
- Metric capacities from 10 N to 50 N
- 10X overload protection

MBI Fatigue Rated Miniature Beam Overload Protected

See page **74**

- Capacities from 2.5 lbf to 10 lbf
- Metric capacities from 10 N to 50 N
- 10X overload protection

SSB Sealed Beam

See page **75**

- Capacities from 50 lbf to 1K lbf
- Metric capacities from 225 N to 4.5 kN
- Environmentally sealed

SPECIAL APPLICATIONS

2101 Dual Range Standard Compression-OnlySee page **42**

- Capacities from 5K lbf/1K lbf to 125K lbf/25K lbf
- Metric capacities from 25 kN/5 kN to 550 kN/125kN
- Dual range compression

**3416 & 3420 Coil Tubing**See page **54**

- Capacities from 30K lbf to 50K lbf
- Hermetically sealed
- ATEX approved

**3430DES-60K Coil Tubing**See page **55**

- 60K lbf capacity
- Hermetically sealed
- Performance to .05%

**BPL Pedal Load Cell**See page **69**

- Capacities from 50 lbf to 500 lbf
- Ultra low height
- For use with gas, brake or clutch pedal

**SPI Platform Scale 3-15 lbf**See page **76**

- 400% compression overload protection
- Eccentric load compensated
- Tension & compression overload protection

**SPI Platform Scale 25-150 lbf**See page **77**

- Compensated strain gages
- Safe overload to 200%
- Eccentric load compensated

**A4200 & A4600 Weighcheck**See page **78**

- Capacities from 2.5K to 50K
- Metric capacities from 1.1 kg to 23K kg
- For tank and specialty weighing

with one of our
Application Engineers.*

MULTI-AXIS

1216 Axial TorsionSee page **30**

- Measures torque & load
- Minimal crosstalk
- Fatigue rated

**2816 Axial Torsion**See page **31**

- Capacities from 3.3K/2K, 5K/3K, 10K/6K, 15K/7.5K
- Measures load and torque
- Minimal crosstalk

**1516 Axial Torsion**See page **33**

- Capacities 100 lb 50 lbf-in (Axial/Torsion)
- Axial force torque
- Minimal crosstalk

**5200 Multi-Axis**See page **43**

- Measures load & moment
- Minimal deflection
- Low crosstalk

INSTRUMENTATION & CALIBRATION SYSTEMS

500 In-Line Signal Conditioner

See page 144

- Output of ± 5 VDC Bipolar & 4-20 mA
- 12-24 VDC power
- DE-9 connector

SGA AC/DC Powered Signal Conditioner

See page 145

- User selectable analog output $\pm 10V$, $\pm 5V$, 4-20 mA
- 110 VAC, 220 VAC, or 18-24 VDC power
- Selectable filtering 1 Hz to 5K Hz

DMA DIN Rail Mount Signal Conditioner

See page 146

- User selectable analog output $\pm 10V$, $\pm 5V$, 4-20 mA
- 12-24 VDC power
- Selectable input ranges

DCA Vehicle Compatible Signal Conditioner

See page 147

- 10-28 VDC power
- NEMA 4X enclosure
- User selectable analog output $\pm 10V$, $\pm 5V$ or 4-20mA

9820 General Purpose Indicator

See page 150

- 5 digit bipolar LED display
- Nonlinearity $< \pm 0.01\%$
- Front panel shunt calibration

9830 High Speed Digital Indicator

See page 151

- 120 readings per second
- Programmable analog output
- Front panel shunt calibration

9834 High Level Input Digital Indicator

See page 152

- 120 readings per second
- Peak and valley monitoring
- Remote and front panel tare

9840 Intelligent Indicator

See page 153

- TEDS Plug & Play Ready (see Page 149)
- 1 or 2 channel
- USB port

9860 TEDS Indicator

See page 154

- TEDS Plug & Play Ready (see Page 149)
- 150 conversions per second
- Bidirectional RS232

9850 Rotary Torque Indicator

See page 155

- Includes graphical logging software
- 2000 readings/second
- Torque, speed and HP, load, angle, position display

9320 Hand Held Battery Powered Indicator

See page 156

- TEDS Plug & Play Ready (see Page 149)
- 7 1/2 digit LCD display
- Environmentally sealed

9300 Weight Indicator

See page 157

- 6-digit display
- Powers up to 8 load cells
- 15 readings/second typical

9390 Battery Powered Weight Indicator

See page 158

- 100,000 display graduations
- Powers up to 4 load cells
- Battery powered

UMC 600 Weight Indicator/Controller

See page 159

- Powers up to 8 load cells
- 10 readings/second with adjustable digital averaging
- 5-point linearization

Gold Standard™ Load Cell Calibration System

See page 161

- Reduces calibration time 50-90%
- Eliminates errors
- Automatic calculation & archiving

Gold Standard™ E4 Machine Calibration System

See page 161

- Portable
- Eliminates errors
- Reduces verification times up to 90%

Precision mV/V Load Cell Simulator

See page 163

- Most accurate simulator
- Special low thermal emf construction
- Instrument substitution testing

HRBSC High Resolution Signal Conditioning Board

See page 165

- High thermal stability
- Shunt calibration, software selectable
- Bipolar

ROTARY TORQUE

T1 Torque Coupling

See page 80

- Capacities from 50 to 1K Nm (442 to 8,850 lb-in)
- Shortest installed length
- Integrated double-flex disc coupling

T2 Precision

See page 82

- Capacities from 0.1 to 20K Nm (0.88 to 177K lb-in)
- +5 VDC output
- Digital electronics

T3 Precision-Pedestal

See page 86

- Capacities from 0.1 to 20K Nm (0.88 to 177K lb-in)
- Integral mounting base
- +5 VDC output

T4 General Purpose

See page 90

- Capacities from 0.1 to 1K Nm (0.88 to 8.85K lb-in)
- +5 VDC output
- Digital electronics

T5 General Purpose-Pedestal

See page 94

- Capacities from 0.1 to 1K Nm (0.85 to 8.85K lb-in)
- +5 VDC output
- Digital electronics

T6 Dual Range

See page 98

- Dual range capacities - 10:1 ratio (5/0.5 to 20K/2K Nm) (44.3/4.43 to 177K to 17.7K lb-in)
- +5 VDC output
- Stainless steel shaft

T7 Dual Range-Pedestal

See page 102

- Dual range capacities - 10:1 ratio (5/0.5 to 20K/2K Nm) (44.3/4.43 to 177K to 17.7K lb-in)
- +5 VDC output
- 5 kHz sample rate

T8 LC

See page 106

- Capacities from 0.2 to 200 Nm (1.77 to 1.77K lb-in)
- Stainless steel shaft
- +5 VDC output

T11 Bearingless

See page 108

- Capacities from 0.005 to 150 Nm (0.04 to 1,327 lb-in)
- Bearingless
- High speed - to 30K RPM

T12 Square Drive

See page 110

- Capacities from 0.10 to 5K Nm (0.88 to 44K lb-in)
- +5 VDC output
- 12-28 VDC supply

T14 Slip-Ring

See page 113

- Capacities from 1 to 500 Nm (8.85 to 4.4K lb-in)
- Integrated speed and angle measurement option
- Both shaft ends with keyway

T15 Hex Drive

See page 116

- Capacities from 0.2 to 20 Nm (1.77 to 177 lbf-in)
- Contactless - no slip rings
- High-level $\pm 5V$ output

T22 Pulley

See page 118

- Capacities from 20 to 5K Nm (177 to 44K lb-in)
- +5 VDC output
- Digital electronics

RT10E High Capacity

See page 120

- Capacities from 3 to 450K Nm (25 to 2M lb-in)
- High accuracy
- Infinite fatigue life

RT12E High Capacity

See page 122

- Capacities from 0.1 to 1.4 Nm (10 to 200 oz-in)
- High accuracy
- 2X overload rating

REACTION TORQUE

MRT Miniature

See page 124

- Capacities from 0.2 to 20K Nm (1.77 to 177 lb-in)
- Small size - 1.6 in OD x 1.25 in
- Excellent linearity & repeatability

MRT2 Miniature Overload Protected

See page 125

- Capacities from 0.2 to 50 Nm (1.77 to 443 lbf-in)
- Overload protected to 3X capacity (0.2 and 2Nm only)
- Proprietary Interface temperature compensated strain gages

5400 Series Flange Style

See page 126

- Capacities from 226 to 565K Nm (2K to 500K lb-in)
- High torsional stiffness
- Flange mount

5330 Hollow Flange

See page 128

- Capacities from 6.78 to 11.30 Nm (60 to 100K lb-in)
- High torsional stiffness
- Extraneous load resistance

5350 Solid Flange

See page 129

- Capacities from 0.07 to 1.41 Nm (10-200 oz-in)
- High torsional stiffness
- Extraneous load resistance

5355 Solid Flange

See page 129

- Capacities from 1.2 to 12K Nm (10 to 100K lb-in)
- High torsional stiffness
- Extraneous load resistance

TS11 Flange Style

See page 130

- Capacities from 10 to 20K Nm (88.5 to 177K lb-in)
- Compact
- Thru-hole design

TS12 Shaft Style

See page 132

- Capacities from 0.005 to 20K Nm (0.04 to 177K lb-in)
- Stainless steel shafts
- Compact

TS14 Square Drive

See page 134

- Capacities from 2 to 5K Nm (17.7 to 44.2 lbf-in)
- Simple operation - no moving parts
- Useful for auditing fastener torques

TS15 Square Flange

See page 136

- Capacities from 2 to 2K Nm (17.7 to 17.7K lbf-in)
- Convenient flange mounting
- Useful for checking torque wrenches

TS16 Square Flange

See page 138

- Capacities from 2 to 2K Nm (17.7 to 17.7K lbf-in)
- Convenient flange mounting
- Accepts standard sockets

TS17 Hex Drive

See page 139

- Capacities from 0.2 to 20 Nm (1.77 to 177 lb-in)
- Simple operation - no moving parts
- Useful for auditing fastener torques

TS18 Shaft to Flange Style

See page 140

- Capacities from 5 to 5K Nm (44.3 to 44.3K lbf-in)
- Keyed shaft per DIN 6885.1
- Convenient flange mounting

TR1 Rod End

See page 141

- Capacities from 25 oz-in to 1K lb-in (0.18 to 110 Nm)
- Stainless steel
- Small size

TS19 Short Flange Style

See page 142

- Capacities from 100 to 5K Nm (885 to 44.3K lbf-in)
- Short, rugged, compact design
- Both ends with flange

Model 1000 Fatigue Rated Load Cell (U.S. & Metric)

Why the Interface model 1000 Fatigue Rated Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- 100 million fully reversed cycles
- Performance to 0.03%
- Eccentric load compensated
- Low deflection
- .0008%/°F (.0015%/°C) temp. effect on output
- Barometric compensation
- Shunt calibration
- Tension & compression

Model 1100 Ultra Precision Load Cell (U.S. & Metric)

Why the Interface model 1100 Ultra Precision Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Performance to .02%
- High output – to 4 mV/V
- Eccentric load compensated
- Low deflection
- .0008%/°F (.0015%/°C) temp. effect on output
- Shunt calibration
- High precision base included
- Barometric compensation
- Tension & compression

Model 1101 Ultra Precision Compression-Only Load Cell (U.S. & Metric)

Why the Interface model 1101 Ultra Precision Compression-Only Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Performance to .02%
- High output – to 4 mV/V
- Eccentric load compensated
- Low deflection
- .0008%/°F (.0015%/°C) temp. effect on output
- Shunt calibration
- High precision base included
- Barometric compensation

Model 1200 Standard Load Cell (U.S. & Metric)

Why the Interface model 1200 Standard Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Performance to .04%
- High output – to 4 mV/V
- Eccentric Load compensated
- .0008%/°F (.0015%/°C) temp. effect on output
- Low deflection
- Shunt calibration
- Barometric compensation
- Tension & compression
- Compact size

Model 1201 Standard Load Cell Compression-Only (U.S. & Metric)

Why the Interface model 1201 Standard Load Cell Compression-Only is the best in class:

- Performance to 0.03%
- High output – to 4 mV/V
- Eccentric load compensated
- .0008%/°F (.0013%/°C) temp. effect on output
- Low deflection
- Shunt calibration
- Barometric compensation
- Compact size
- Counterbored mounting holes

Model 1200 Standard 3-Wire Amplified Load Cell Universal or Compression-Only (U.S. & Metric)

Why the Interface model 1200 Standard 3-Wire Amplified Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Eccentric load compensated
- Low deflection
- Shunt calibration
- Tension & compression
- Compact size
- 3-wire internal amp choice of 4-20 mA, $\pm 5V$, $\pm 10V$, 0-5V, 0-10V

DIMENSIONS

INTERFACE FORCE & TORQUE CALIBRATION LAB

Why Interface

- Interface Gold Standard™ Calibration Software used for data collection and analysis
- Highly trained and experienced calibration staff
- Test data permanently archived
- Calibration of all manufacturers' load cells
- System calibrations with any combination of load cells/instrumentation
- Dependable 5-day turnaround (2-day expedited service available)
- Customer contact within 24 hours after receiving parts
- Industry's most complete calibration certificate

FORCE

- Direct traceability to NIST
- A2LA accredited force lab
- 50g to 1 million lbf capacity
- Seven hydraulic systems
- Six deadweight systems
- Only NIST certified Gold Standard™ Load Cells used as reference standards

Services

Calibration

- MIL-STD-45662A, ANSI/NCSL Z540-1
- ASTM E74, Gold Standard™
- Custom calibrations to fit customer needs
- Individual load cell & system calibrations
- Hydraulic force systems perform tension and compression calibrations with one setup
- Custom adaptors are made in house to customer specifications, which allows us to simulate real world applications

Repair

- Dependable seven day (or less) turnaround for repair services (includes calibration)
- Connector replacement on any manufacturers' load cell (if available)
- Highly trained & experienced repair technicians
- Complete load cell evaluation prior to repair and calibration free of charge

TORQUE

- Traceable to National Metrology Institutes
- Capacities to 50K lb-in
- Hydraulic & deadweight systems

CONTACT: Repair/Recal Department • 800-947-5598 x152

Model 1700 Flange Load Cell

Why the Interface model 1700 Flange Load Cell is the best in class:

- Standard flange design mounts directly to cylinders
- Proprietary Interface temperature compensated strain gages
- Performance to .05%
- Eccentric load compensated
- .0008%/°F (.0015%/°C) temp. effect on output
- Low deflection
- Shunt calibration
- Barometric compensation
- Tension & compression

Model 1216 Axial Torsion Load Cell

Why the Interface model 1216 Axial Torsion Load Cell is the best in class:

- Measures load and torque
- Minimal crosstalk
- Extraneous load resistance
- Fatigue rated

OPTIONS

- Integral Cable
- Compression Overload Protection
- Connector Protector

Model 1500 Standard Low Capacity Load Cell (U.S. & Metric)

Why the Interface model 1500 Standard Low Capacity Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Performance to .05%
- Compact 2¾ in (70 mm) diameter
- Fatigue rated
- Eccentric load compensated
- .0008%/°F (.0015%/°C) temp. effect on output
- Shunt calibration
- Low deflection

Model 1600 Gold Standard™ Calibration Load Cell

Why the Interface model 1600 Gold Standard™ Calibration Load Cells are the best in class:

- Tension & compression in one unit
- .005% nonrepeatability
- .01% creep
- High output – to 4 mV/V
- High precision base installed
- 3 run NIST traceable ASTM E74 calibration
- Factory installed calibration adapter
- Eccentric load compensated
- .0008%/°F temp. effect on output
- 4% lower load limit per ASTM E74
- Calibration conforming to ISO 376

Model 1606 Gold Standard™ Low Capacity Calibration Load Cell

Why the Interface model 1606 Gold Standard™ Low Capacity Calibration Load Cells are the best in class:

- Capacities from 50 lbf to 300 lbf (250N to 1,500N)
- Tension and compression in one unit
- .005% nonrepeatability
- .02% creep
- 3 run NIST traceable ASTM E74 calibration
- Factory installed calibration adapter
- Eccentric load compensated
- .0008%/°F temp. effect on output
- 4% lower load limit per ASTM E74
- Higher capacities available

Model 1800 Platinum Standard™ Calibration Load Cell

Why the Interface model 1800 Platinum Standard™ Calibration Load Cell is the best in class:

- Handcrafted excellence for the most demanding calibration requirements
- Tension & compression in one unit
- .005% nonrepeatability
- 2% lower load limit per ASTM E74
- High precision base installed
- ASTM E74 calibration standard
- Eccentric load compensated
- .0008%/°F temp. effect on output
- Connector protector standard
- Calibration conforming to ISO 376

*Additional capacities available, call factory for details

STANDARD CONFIGURATIONS

PT02E-12-8P Connector

Model 2101 Dual Range Standard Load Cell Compression-Only (U.S. & Metric)

Why the Interface model 2101 Dual Range Standard Load Cell Compression-Only is the best in class:

- Dual range allows for accurate measurements throughout test range
- 4X to 5X overload protection on lower capacity load cell
- Proprietary Interface temperature compensated gages
- High output for both ranges-to 4 mV/V
- Eccentric load compensated
- Shunt calibration
- Low deflection

SPECIFICATIONS

Lower Capacity Same as
1101 Compression-Only Low Profile (See Page 16)

Higher Capacity Same as
1100 Universal Low Profile (See Page 14)

Model 5200 Multi-Axis Load Cell

Why the Interface model 5200 Multi-Axis Load Cell is the best in class:

- Simultaneously measure thrust and moment perpendicular to the thrust axis
- Thrust axis functions to the same specifications as a Model 1200
- Thrust stiffness and moment stiffness are both very high because of the low profile construction

Base included

SPECIFICATIONS

Static Error Band–Thrust, 300-2K±0.04
5K-50K±0.05

Model 3200 Standard Stainless Steel Load Cell

Why the Interface model 3200 Standard Stainless Steel Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Hermetically sealed
- Performance to .05%
- Compact size
- High 4 mV/V output
- Eccentric load compensated
- .0008%/°F temp. effect on output
- Low deflection
- Shunt calibration
- Barometric compensation

Optional base

Model 3200 Standard Stainless Steel Compression-Only Load Cell

Why the Interface model 3200 Standard Stainless Steel Compression-Only Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Hermetically sealed cell
- Performance to .04%
- Compact size
- High 4 mV/V output
- Eccentric load compensated
- .0008%/°F temp. effect on output
- Low deflection
- Shunt calibration
- Barometric compensation

Model ULC Ultra Low Capacity Load Cell

Why the Interface model ULC Ultra Low Capacity Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Highest performance gram cell in the world
- Overload protected
- Safe side load overload to 5X capacity
- Low extraneous load sensitivity
- Low temperature effect on zero (0.002%/°F)
- Capacity down to 50 grams
- Tension & compression

Model SMA Series Miniature S-Type Load Cell (U.S. & Metric)

Why the Interface model SMA Miniature S-Type Load Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Performance to .05%
- Small compact design
- Tension & compression

STANDARD CONFIGURATION

5 ft Integral Cable (SMA-nn)

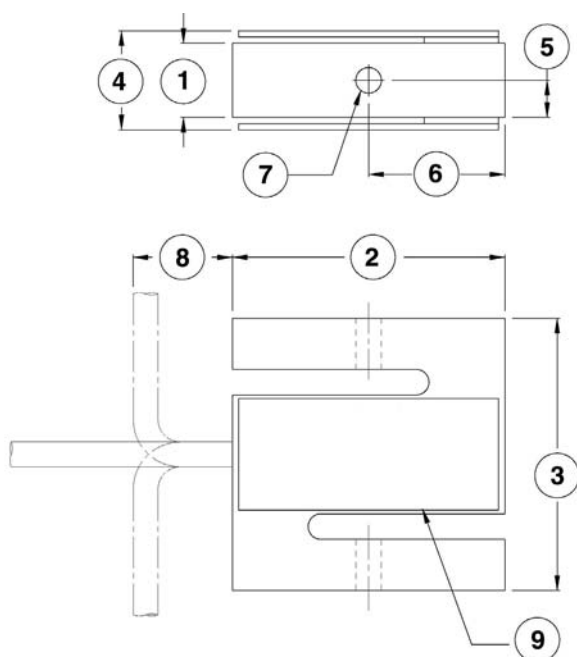

OPTIONS*

Extra Cable Length
Standardized Output

ACCESSORIES*

Model BPL Pedal Load Cell

Capacities 50-500 lbf

Why the Interface model BPL Pedal Load Cell is the best in class:

- Lowest nonlinearity and hysteresis of any brake pedal load cell – < 0.05%
- Ultra low height
- Low sensitivity to off-center loads - <1.0%/in
- Mounts directly to pedal with included strap(s)
- Interchangeable mounting plates
- Storage case included
- For use with gas, brake or clutch pedal
- Storage case included

Model A4200 & A4600 Weighcheck Load Cell

Why the Interface model A4200 and A4600 Weighcheck Load Cells are the best in class:

- Capacity ranges from 2.5K to 50K
- High output – 4 mV/V
- Self-centering in all directions
- High safe side load – to 400%
- Standardized output - $\pm 0.1\%$
- Zinc plated (A4200) or stainless steel (A4600)
- Factory assembled for easy field installation
- Static/dynamic/in-motion capabilities
- Low height—4.0" for 2.5K, 5K & 10K;
5.0" for 25K & 50K

Model 2100 High Capacity Column Load Cell (U.S. & Metric)

LOAD

Why the Interface model 2100 High Capacity Column Load Cell is the best in class:

- Capacities to 1000K lbf or 4450 kN
- Performance to $\pm 0.15\%$ FS
- Compact size
- Metric and English models

OPTIONS*

Compression-Only available. Ask factory for specifications and dimensions.

- Multiple Bridge
- Standardized Output
- ASTM E74 Calibration
- Special Thread Size
- Handles

ACCESSORIES*

- Mating Connector
- Cable Assembly

*Please consult factory for additional information

Model T1 Torque Coupling Rotary Torque Transducer

Why the Interface model T1 Torque Coupling Rotary Torque Transducer is the best in class:

- Capacities from 50 to 1K Nm (442 to 8,850 lb-in)
- Shortest installed length
- Integrated double-flex disc coupling
- Hollow
- Bearingless non-contact design
- ± 15 bit resolution
- 10 kHz sample rate
- ± 5 VDC output

T1 Torque Coupling Rotary Torque Transducer

Model T2 Precision Rotary Torque Transducer

Why the Interface model T2 Precision Rotary Torque Transducer is the best in class:

- Capacities from 0.1 to 20K Nm (0.88 to 177K lb-in)
- ± 5 VDC output
- Digital electronics
- Stainless steel shaft
- 12 to 28 VDC supply
- Contactless
- 10 kHz sample rate

T2 Precision Rotary Torque Transducer

OPTIONS

Speed & Angle Measurement - 360 Pulse TTL, 2-Tracks 90° Offset, Available on capacities up to 1,000 Nm only
 Speed Output - 60 Pulse TTL, 1-Track, Available on capacities 2,000 Nm & above
 ± 10 V Torque Output
 RS485
 High RPM
 Keyed Shafts
 SAE Sized Shafts

Model T5 General Purpose-Pedestal Rotary Torque Transducer

Why the Interface model T5 General Purpose-Pedestal Rotary Torque Transducer is the best in class:

- Integral mounting base
- ± 5 VDC output
- Digital electronics
- Stainless steel shaft
- 12 to 28 VDC supply
- Contactless
- 10 kHz sample rate
- Capacities from 0.1 Nm to 1K Nm (0.85 to 8.85K lb-in)

T5 General Purpose-Pedestal Rotary Torque Transducer

OPTIONS

Speed & Angle Measurement - 360 Pulse TTL, 2-Tracks 90° Offset, Available on capacities up to 1,000 Nm only
 Speed Output - 60 Pulse TTL, 1-Track, Available on capacities 2,000 Nm & above
 ± 10 V torque output
 RS485
 High RPM
 Keyed Shafts
 SAE Sized Shafts

TORQUE

Model T11 Bearingless Rotary Torque Transducer

Why the Interface model T11 Bearingless Rotary Torque Transducer is the best in class:

- Capacities from 0.005 to 150 Nm (0.04 to 1,327 lb-in)
- Bearingless
- High speed - to 30K RPM
- ±5 VDC output
- Very low range
- Eliminates bearing friction effects
- 10 kHz sample rate
- 12-28 VDC supply

T11 Bearingless Torque Transducer

OPTIONS

- +10 VDC Output
- Speed Output - 6 Pulse TTL, 1-Track
- Special Balancing for RPM to 40K

M	Shield	

T14 Slip-Ring Torque Transducer

Model T15 Hex Drive Rotary Torque Transducer

Why the Interface model T15 Hex Drive Rotary Torque Transducer is the best in class:

- Capacities from 0.2 to 20 Nm (1.77 to 177 lbf-in)
- Contactless - no slip rings
- High-level $\pm 5V$ output
- 12-28V supply
- Angle measurement option
- Quick-Connect chuck

T15 Hex Drive Rotary Torque Transducer

OPTIONS

Angle Measurement - 360 Pulse TTL, 2-Tracks 90° Offset
 ± 10 V Torque Output
 Enhanced Accuracy - Combined Error $\pm 0.1\%$
 RS485 Output (Uses 12-pin connector, replaces ± 5 V)

Model RT10E High Capacity Rotary Transformer Torque Transducer

Why the Interface model RT10E High Capacity Rotary Transformer Torque Transducer is the best in class:

- 4X overload rating
- Infinite fatigue life
- Hardened to EMI from adjustable speed drives
- Performance to 0.07%
- Bidirectional operation including stall
- Ferrite-free rotary transformer coupling
- Calibration & balance free of cable effects
- Unexcelled immunity to machinery magnetic fields
- 15-5 PH stainless shaft, splash proof & corrosion resistant
- mV/V output compatible with carrier amplifiers

OPTIONS*

- On-board Signal Conditioning**
- Digital Output-RS232**
- Enhanced Performance
- Foot Mount (shown in photo)
- Standard & Zero Velocity Speed Pickups
- Flange Style Mount

ACCESSORIES*

- Interconnect Cables
- Digital Readout (9850) Page 155

*Please call for additional information
 **Please consult factory for specifications

*Stiffness is conservatively rated and includes both the torsion section and shaft ends.

Model MRT Miniature Reaction Torque Transducer

Why the Interface model MRT Miniature Reaction Torque Cell is the best in class:

- Proprietary Interface temperature compensated strain gages
- Low capacity - as low as 1.77 in-lb (0.2 Nm)
- Small size - 1.6 in OD x 1.25 in
- Excellent linearity & repeatability
- Low deflection - high torsional stiffness

DIMENSIONS

See Drawing	CAPACITY (Nm)

Model MRT2 Miniature Overload Protected Reaction Torque Transducer

Why the Interface model MRT2 Miniature Overload Protected Reaction Torque Transducer is the best in class:

- Capacities from 0.2 to 50 Nm (1.77 to 443 lbf-in)
- Overload protected to 3X capacity (0.2 and 2Nm only)
- Proprietary Interface temperature compensated strain gages
- Small size - 1.6 in OD X 1.25 in
- Low deflection - high torsional stiffness

Model TS14 Square Drive Reaction Torque Transducer

Why the Interface model TS14 Square Drive Reaction Torque Transducer is the best in class:

- Capacities from 2 to 5K Nm (17.7 to 44.2 lbf-in)
- Simple operation - no moving parts
- Useful for auditing fastener torques
- Fits standard socket wrenches

INTERFACE FORCE & TORQUE CALIBRATION LAB

Why Interface

- Interface Gold Standard™ Calibration Software used for data collection and analysis
- Highly trained and experienced calibration staff
- Test data permanently archived
- Calibration of all manufacturers' load cells
- System calibrations with any combination of load cells/instrumentation
- Dependable 5-day turnaround (2-day expedited service available)
- Customer contact within 24 hours after receiving parts
- Industry's most complete calibration certificate

FORCE

- Direct traceability to NIST
- A2LA accredited force lab
- 50g to 1 million lbf capacity
- Seven hydraulic systems
- Six deadweight systems
- Only NIST certified Gold Standard™ Load Cells used as reference standards

Services

Calibration

- MIL-STD-45662A, ANSI/NCSL Z540-1
- ASTM E74, Gold Standard™
- Custom calibrations to fit customer needs
- Individual load cell & system calibrations
- Hydraulic force systems perform tension and compression calibrations with one setup
- Custom adaptors are made in house to customer specifications, which allows us to simulate real world applications

Repair

- Dependable seven day (or less) turnaround for repair services (includes calibration)
- Connector replacement on any manufacturers' load cell (if available)
- Highly trained & experienced repair technicians
- Complete load cell evaluation prior to repair and calibration free of charge

TORQUE

- Traceable to National Metrology Institutes
- Capacities to 50K lb-in
- Hydraulic & deadweight systems

CONTACT: Repair/Recal Department • 800-947-5598 x152

Model TS15 Square Flange Style Reaction Torque Transducer

Why the Interface model TS15 Square Flange Style Reaction Torque Transducer is the best in class:

- Capacities from 2 to 2K Nm (17.7 to 17.7K lbf-in)
- Convenient flange mounting
- Useful for checking torque wrenches

Interface Amplified Load Cells

Why the Interface Amplified Load Cells are the best in class:

- High level voltage or current output
- Increased signal to noise ratio
- 2-wire 4-20
- Zero and span adjustment
- 3-wire 4-20, ± 5 or ± 10 VDC
- Internal shunt calibration
- Bipolar or unipolar

In addition to our many external signal conditioning options, Interface also offers load cells with internal amplifiers. Benefits of an internal amplifier include increased signal to noise ratio, fewer components to troubleshoot and high output directly from the load cell package. Both a 2-wire and 3-wire version are available. Each is reverse voltage protected to prevent damage from accidental mis-wiring. Common features include shunt calibration and pots for zero and span adjustment. In standard configuration the pots are protected by removable screw caps but by request can be sealed at the factory, preventing field adjustment.

INSTRUMENTATION

The 2-wire amplifier is a 4-20 mA loop powered device. Featured in our model 2404 series cell, the 2-wire amplifier is suitable for process control and rugged industrial use. The 2404 series is an environmentally sealed Stainless Steel load cell based on our popular 2400 series. Output is either 4-20 mA compression, 4-20 mA tension, or 12 mA ± 8 mA tension & compression. O-ring seals protect the pots. Internal shunt calibration is optional. Supply voltage is 9-28 VDC.

The 3-wire amplifier is available as an option on our model 1200 series Low Profile load cells capacities from 300 to 1 million lbf. Configured as a factory add-on option, the 3-wire amplifier can be added to any of our stocked Low Profile load cells. Powered between 11 and 28 VDC, the 3-wire amplifier is suitable for vehicle or battery powered applications. Available outputs are ± 5 VDC, ± 10 VDC, 4-20 mA or 12 ± 8 mA. For current output maximum load resistance is 500 ohms. A precision internal shunt resistor is included for easy field adjustment.

Transducer Electronic Data Sheet (TEDS) SELF-ID Load Cell

- Load cell with electronic identification inside
- Meets IEEE 1451.4 standard for smart transducer interface
- Available on new or existing load cells
- Plug & Play Ready
- Cuts instrument setup time
- Eliminates data entry error
- Sensor information and calibration data

Actual size compared to standard load cell

INSTRUMENTATION

Interface has offered sensors with various types of SELF-ID for many years. The SELF-ID features eliminates the need to enter data via a keyboard or key panel from a paper calibration sheet into the instrument used with the load cell. This feature offers the following benefits:

- Eliminates potential for data entry error
- Cuts time in half to set up instrument
- Makes swapping of load cells easy
- Increases safety by making certain that system has the correct capacity of the load cell
- Can be used to identify location of load cell
- No need to store calibration sheets, no more paper, no more concern about lost sheets
- Makes inventory control of your load cells easy
- Load cells can be changed out without jeopardizing integrity of system

Now TEDS provides additional advantages over proprietary SELF-ID because it is an industry standard (IEEE 1451.4) which has the potential to permit mix and matching of load cells and instruments from different manufacturers.

IEEE1451.4 specifies a table of identifying parameters that are stored in the load cell in the form of a TEDS (Transducer Electronic Data Sheet). TEDS is a table of parameters that identify the transducer and is held in the transducer on a EEprom for interrogation by external electronics.

Model 9820 General Purpose Indicator

- Bipolar
- 5 digit bipolar LED display
- Nonlinearity < $\pm 0.01\%$
- Analog output – ± 10 VDC, with 2 kHz bandwidth
- Front panel shunt calibration, tension or compression, internal or external resistor
- Peak and valley monitoring
- Remote and front panel tare
- Transformer minimizes noise

STANDARD CONFIGURATION

9820-000-1 110 V with ± 10 V analog output

OPTIONS

Bench top enclosure

SPECIFICATIONS

EXCITATION

Excitation Voltage.....5, 10, VDC
(jumper selectable)

Current.....60, 120 mA respectively

PERFORMANCE

Maximum Display Range $\pm 99,999$

Internal Resolution..... $\pm 19,999$ counts

Signal Input Range..... ± 50 mV

Sensitivity.....1.2 μ V/count

Readings Per Second.....2.5

Maximum Error0.01% FS
 ± 1 count

CMR.....120dB

ENVIRONMENTAL

Operating Temperature.....14 to 122°F
-10 to 50°C

Relative Humidity – MAX90% at 104°F,
non-condensing

POWER

AC115 OR 230 VAC
50–60 Hz

Power Consumption.....6 watt

MECHANICAL

Size3.78" W, 1.89" H, 5.5" D
(96 X 48X 140 mm)

Weight1.3 lb (575g)

DisplayLED 14 segment,
.4" H

Panel Cutout.....3.62" W X 1.77" H
(92 X 45 mm)

FAST ANALOG OUTPUT2 kHz

INSTRUMENTATION

Model 9830

High Speed Digital Indicator

- Sample rate 120 readings per second
- 4 limit setpoints with solid s/h relays
- Programmable analog output, ± 10 VDC and 4-20 mA, 2000 Hz bandwidth
- 5 digit bipolar LED display
- Nonlinearity $< \pm 0.01\%$
- Front panel shunt calibration
- Peak and valley monitoring
- Remote and front panel tare
- Powers four 350 load cells
- Designed for CE compliance
- Bidirectional RS232

SPECIFICATIONS

EXCITATION

Excitation Voltage.....	5, 10, VDC (jumper selectable)

STANDARD CONFIGURATION

- 9834-V-1 Voltage input with ± 10 V analog output and 4-20 mA
- 9834-C-1 Current input with ± 10 V analog output and 4-20 mA

OPTIONS

- Bench top enclosure
- 230 VAC power

INSTRUMENTATION

Model 9840 Intelligent Indicator

- TEDS Plug & Play Ready!
IEE1451.4 compliant
- 1 or 2 Channel
- Remote sense excitation
- 5 & 6 point linearization
- Bipolar
- $\pm 999,999$ display counts
- Nonlinearity $< \pm 0.005\%$
- Auto setup for multiple load cells
- Fast, direct analog output
- ± 10 VDC scalable analog output - 16 bit
- Full duplex RS232C communication
- Peak/valley hold with front panel reset
- Front panel and remote tare
- 8 selectable digital filters
- Auto zero
- Front panel shunt calibration
with two selectable resistors
- Display units conversion:
Lb, Kg, N, Psi, Mpa, Klb, KN, t, mV/V
- Two-line vacuum fluorescent display
- Quadrature encoder channel available
- mV/V Calibration
- USB port

STANDARD CONFIGURATION

9840-100-1 110V single channel

OPTIONS

Second channel
Quad limits
RS485 output
4-20 mA analog output
Panel mount bracket
Multi-drop RS232/485

SPECIFICATIONS

EXCITATION

Voltage 5 or 10 VDC
Current – MAX 180 mA

OUTPUTS

Serial Interface RS232 duplex
Output – Analog, 16 bit Scalable, ± 10 VDC
Output – Analog, Direct 1.5 kHz BW
Output – Analog 4–20 mA (optional)
Limits Quad-programmable

PERFORMANCE

Maximum Display Counts $\pm 999,999$
Display Update 4 / sec.
Internal Resolution 24 bits
Signal Input Range ± 4.5 mV/V
Programmable Count - by 1, 2, 5, 10, and 20
Conversion Rate 60 / sec.
Maximum Error 0.01% FS
..... ± 1 count
CMRR 115 dB

CN-208 mating connector (included)

INSTRUMENTATION

Interface Gold Standard™ Calibration Systems

A fully integrated PC-based solution for calibration of load cells and force test machines

Why the Interface model Gold Standard™ Calibration System is the best in class:

- **Controlled calibration process reduces calibration times by 50% to 90% and produces consistent calibration results**
- **Easy-to-use software reduces operator training time**
- **Fully integrated reporting functions**
- **Automatic archiving of calibration results**
- **Supports ASTM E74, ASTM E4 and ISO 7500/1, EN10002**
- **Industry Accepted terms and calculations**
- **0.1µV display resolution**
- **Used in over 150 calibration labs world-wide**

Gold Standard™ Load Cell Calibration System

The Interface load cell calibration system combines highly accurate load cell signal conditioning, calibration standard load cells and state of the art calibration software. In this system a Gold Standard™ or Platinum Standard™ load cell is placed in line with the load cell to be calibrated in a hydraulic or mechanical force test machine. The system steps through a sequence of test points, either manually or automatically and then calculates performance specifications such as Linearity and Hysteresis, stores the data and creates test reports.

Gold Standard™ E4 Machine Calibration System

The Interface E4 verification system integrates the ultra-accurate 9840 Intelligent Indicator with any laptop computer. This creates a portable system for in-field verification of force test machines. The verification involves insertion of a reference load cell (such as the Interface Gold Standard™ Load Cell) into the equipment under test. Each data point in the test frame controller is compared against the reading from the reference load cell.

Gold Standard™ Load Cell Calibration System

SYSTEM INCLUDES

- One SCB1 2 Channel Signal Conditioning Board
- One ICS-202 Force Calibration Software
- One SIS-103 One-Day Training at Interface
- One CT-139-10 SCB1 to GS Load Cell Cable
- One CT-142-10 SCB1 to Standard Load Cell Cable
- One CX-0440 mV/V Transfer Standard
- One SIS-104 System Setup

OPTIONS

- HRBSC Boards
- 9840-200-1 Dual Channel
- DA-101 For Test Machine Automation
- HL-410 For High Level Outputs
- CX-0610 or Other Multi-Step mV/V Transfer Standard
- USB Chassis for Signal Conditioning Board(s)

Gold Standard™ E4 Machine Calibration System

SYSTEM INCLUDES

- 9840-100-1 Intelligent Indicator
- One ICS-205 E4 Machine Calibration Software
- One CT-177-10 Gold Standard™ Interconnect Cable Assembly
- Serial Cable, Laptop to 9840
- One CX-0440 ± 4 mV/V Transfer Standard
- One SIS-104 System Setup
- Training at Interface

OPTIONS

- Dual Channel 9840
- CX-0610 or Other Multi-Step mV/V Transfer Standard

Gold Standard™ Calibration System Options

- **GS-USB:** Provides USB interface for HRBSC, SCB1, DA-101 and HL410 instrument boards includes internal power supply, cooling fan and USB cable.
- **SCB1:** 20 bit instrument board provides signal conditioning for the Gold Standard™ System. Available in single or dual channel versions. (See Page 164 for specifications)
- **HRBSC:** High-resolution 22 bit instrument board increases accuracy over the SCB1. (See Page 165 for specifications)
- **DA-101:** Digital to analog board for generating command signal for system control. Provides setpoint signal for servo controlled hydraulic force testing.
- **HL410:** High level 4-channel input board allows calibration of ± 5 and ± 10 VDC output transducers and includes all features of the DA-101.
- **Load Cell Simulator:** mV/V transfer standards are used to calibrate the Gold Standard™ system, and for setting up and testing load cell readout devices. (See Page 163 for more information)
CX-0404 - specifically designed for instrument substitution testing as per ASTM E74.
- **Desktop, laptop or portable PC:** Contact factory for currently available configurations.
- **Gold Standard™ or Platinum Standard™ load cells as required:** See Page's 34-41.

GS-USB

**1611 Gold Standard™
Compression Only**

**1810 Platinum Standard™
Universal Style**

Precision mV/V Load Cell Simulator

- Most accurate load cell simulator
- Special low thermal emf construction
- Each unit individually calibrated, aged and recalibrated
- Strong, rugged design
- Instrument substitution testing

CX-0610

CX-0440

Models CX-0202, CX-0610, CX-0440, CS-0330, and CX-0220 are used for setting up and checking the Gold Standard™ System Hardware. CX-0440, CX-0330, and CX-0220 are single-step mV/V transfer standards providing precision outputs of ± 4 , ± 3 , and ± 2 mV/V respectively. CX-0610 is a multi-step unit that allows the user to go from -6 mV/V to +6 mV/V in 1 mV/V steps.

Model CX-0404 is specifically designed for instrument substitution testing as per ASTM E74.

Specification	CX-0404 Multi-Step Model	CX-0610 Multi-Step Model	CX-0440 Single-Step Model	CX-0330 Single-Step Model	CX-0220 Single-Step Model
Output at zero setting	< 0.5 μ V	< 0.5 μ V	< 1.0 μ V	< 1.0 μ V	< 1.0 μ V
Output settings—mV/V	0, ± 0.04 , ± 0.08 , ± 0.2 , ± 0.4 , ± 0.8 , ± 1.2 , ± 1.6 , ± 2.0 , ± 2.4 , ± 3.2 , ± 4.0 , ± 4.4	-6, -5, -4, -3, -2, -1, +1, +2, +3, +4, +5, +6	-4, +4	-3, +3	-2, +2
Output accuracy at any non-zero setting, normalized to actual zero setting output: Relative to nominal value	0.01% to 0.05% of setting	0.01% of setting	0.01% of setting	0.01% of setting	0.01% of setting
Relative to value provided in unit-specific calibration chart	0.0015% of setting for one year	0.0015% of setting for one year	0.0025% of setting for one year	0.0025% of setting for one year	0.0025% of setting for one year
Temperature coefficient of normalized output	< 5 ppm/°C of setting	< 5 ppm/°C of setting	< 5 ppm/°C of setting	< 5 ppm/°C of setting	< 5 ppm/°C of setting
Input and output resistance: At zero setting	350 ohms $\pm 0.005\%$	350 ohms $\pm 0.005\%$	350 ohms $\pm 0.005\%$	350 ohms $\pm 0.005\%$	350 ohms $\pm 0.005\%$
At output setting (value decreases with increasing setting, either polarity)	> 347.5 ohms	> 347.5 ohms	> 348.5 ohms	> 348.5 ohms	> 348.5 ohms

Model SCB1 Signal Conditioning Board 1 or 2 Channel

- Nonlinearity <0.003% full scale
- 20-bit resolution
- High thermal stability
- Shunt calibration, software selectable
- Single or dual channel versions
- Bipolar
- Isolated output

The SCB1 signal conditioning board comes in a one or two-channel configuration. The single-channel unit is used with a dead weight system and/or for test machine verification, while the two-channel unit is used for calibrations where a reference (Standard) load cell is being used. One channel is connected to the reference standard and one channel is connected to the cell being calibrated.

ACCESSORIES*

- CT-139-10 Interconnect cable (1600 type)
- CT-142-10 Interconnect cable (1000 type)
- CT-154-10 Interconnect cable (pigtailed)
- DA-101 Digital-Analog board, used with automated systems (consult factory)
- GS-USB Chassis to house Signal Conditioning Board(s)

*See appendix for more technical information

SPECIFICATIONS

Model HRBSC High Resolution Signal Conditioning Board

- Nonlinearity <0.001% full scale
- 22-bit resolution
- High thermal stability
- Shunt calibration, software selectable
- Auto ID with Gold Standard load cells
- ISA slot plug-in board
- Bipolar

The model HRBSC is a single-channel high resolution signal conditioning board. This board offers many additional features over the SCB1 for users requiring the highest levels of accuracy and precision.

OPTIONS*

- 5 VDC excitation
- Special shunt calibration resistors

ACCESSORIES*

- CT-134-10 Interconnect cable (1600 type)
- CT-141-10 Interconnect cable (1000 type)
- DA-101 Digital-Analog board, used with automated systems (consult factory)
- GS-USB Chassis to house Signal Conditioning Board(s)

NIST Traceable Load Cell Calibration Service

**INTERFACE
has the
most consistent
and meticulous
calibration
service
in the
industry**

- 1,000,000 lbf capacity (kN, kg, etc. also available)
- Commercial, Mil STD, ASTM E74, Z540, EN10002-3, ISO-376, & System calibrations
- Calibrations for most manufacturer's load cells & instruments
- 1 week turnaround (2 days on special order)

CALL 1-800-947-5598 x152 or x133 FOR QUOTATION

Typical Interface Load Cell Calibration Certification

LOAD CELL CALIBRATION CERTIFICATION

CONDITION: FINAL PROCEDURE: C-1257
 MODEL: 1020BJ-25K-B SERIAL: 99886 BRIDGE: A CAPACITY: 25 K1bf
 INPUT RESISTANCE: 351.2 OHM
 OUTPUT RESISTANCE: 351.2 OHM
 ZERO BALANCE : -0.433 %RO

TEST CONDITIONS

TEMPERATURE: 77 °F HUMIDITY: 47 % EXCITATION: 10 VDC

TRACEABILITY

FORCE STANDARD : STD-9 NIST #: 822.07/258672 DUE: 15-JUN-99
 STANDARD INDICATOR: BRD1 NIST #: 811/249920-92
 TEST INDICATOR : BRD4 NIST #: 811/249920-92

SHUNT CALIBRATION

60 Kohm ± 0.01% TENSION COMPRESSION
 OUTPUT 1.4604 mV/V -1.4588 mV/V
 STRAIGHT LINE conversion 17.579 K1bf 17.569 K1bf

Shunt calibration resistor connections for tension and compression respectively are (+EXC to -OHM) and (+EXC to -OHM) for connector models; (+SENSE to -OHM SHUNTICAL) and (+SENSE to -OHM SHUNTICAL) for 7 wire cable models.

PERFORMANCE

	RATED OUTPUT	SEB OUTPUT	NONLINEARITY	HYSTERESIS	SEB
TENSION	2.0767 mV/V	2.0769 mV/V	.006 %FS	.013 %FS	± .008 %FS
COMPRESSION	-2.0758 mV/V	-2.0757 mV/V	-.003 %FS	.001 %FS	± .002 %FS

STATE: ERROR BAND (SEB) - The band of maximum deviations of the ascending and descending calibration points from a best fit straight line through zero OUTPUT. It includes the effects of NONLINEARITY, HYSTERESIS, and nonreturn to MINIMUM LOAD.

TEST LOAD APPLIED (K1bf)	RECORDED READINGS (mV/V)	
	Tension	Compression

ASTM E74 Calibration

INTRODUCTION

The E74 procedure has been developed by the ASTM E-28 committee on Mechanical Testing as a standard for instruments used for verifying force indication of materials testing machines. The standard is being adopted for use with load cells in other applications also, as it presents a uniform and rigorous approach to calibration.

INTERFACE CAPABILITY

Interface, Inc. provides calibration on load cells up to 1,000,000 lbf capacity. The lower capacity calibrations are performed with deadweights and the higher capacities use secondary standard load cells in a comparison procedure. Interface secondary standards are calibrated by primary standards at NIST annually. The secondary standards are useful over their Class AA (most restrictive) range as determined by the NIST calibration per E74; the load cells being calibrated at Interface are then useful over their Class A range which is stated on the calibration certificate. With the secondary standard load cells, Interface can provide calibrations at virtually any load values within the capacity range, ascending or descending, and in any force units: lbf, kN, kg, etc.

FEATURES OF E74

The key elements of the E74 procedure include the application of at least 10 different forces approximately equally spaced, each of which must be applied at least 2 times, and the total of all force applications must be at least 30. Typically, 10 forces are applied in 3 sequences. The load cell is rotated in position in the test frame between sequences to randomize errors caused by loading conditions.

Upon completion of the tests, a polynomial equation is fitted to the 30 readings using regression analysis. The degree of the equation, degree 2 through degree 5 being possible, is determined per E74 test criteria and the highest degree allowed is used. A standard deviation is calculated from the errors of the readings relative to the fitted equation per the E74 procedure. From this calculation, the uncertainty and lower load limit of the Class A range are in turn calculated.

CERTIFICATION

A test report is provided with each calibration stating the forces applied, the corresponding readings, the coefficients of the polynomial equation, the fitted output at each load, the standard deviation, uncertainty, lower load limit, error plots, NIST traceability information, and environmental conditions at the time of test. The previous page show an example of a test report for a tension & compression calibration.

MULTIPLE CALIBRATIONS WITH CURVE FIT.

Three calibrations are performed rotating the load cell in the load frame by 120° between each test. All test data is presented in a tabular form. A curve is fitted to the data and the standard deviation of all test points about the fitted curve is calculated. The calibration record states that all measurements are traceable to NIST and provides the force standard test reference number.

Low Profile Options

Positive Compression Overload Protection for Low Profile Load Cells

The positive overload option is useful when high overloads occur in applications such as: impact loads on weighing platforms; engine malfunctions during rocket or jet engine testing; transient overloads on engine dynamometers.

The unique design of INTERFACE load cells allows incorporation of a simple positive overload stop to protect against overload in compression. This stop engages at approximately 125% of cell capacity.

Compression-Only cells with the overload option may be operated to 5 times rated capacity without damage in capacities through 25,000 pounds. 50,000 pound capacities and larger may be operated to 3 times rated capacities.

Load cells with positive overload protection must be ordered with an INTERFACE installed base.

Bases for Low Profile Load Cells

These heat treated, high strength bases are available in standard sizes. When the base and load cell are ordered together, a plug is supplied in both the cell and the base to prevent damage or errors caused by over engagement of mating parts. Standard thread size is the same as the mating load cell.

BASES OR FLAT MOUNTING SURFACES ARE REQUIRED FOR ALL LOW PROFILE LOAD CELL INSTALLATIONS. A mounting surface that is flat to 0.0002" T.I.R. (total indicator reading) is required, unless a base is installed.

Center hub deflects under the load until it contacts the base which provides positive overload protection. The center tapped hole is sealed to keep overload surfaces clean.

Options

Standardized Output

The output of INTERFACE load cells stated in the catalog is the nominal output. In reality, the load cells come from production with a tolerance band of approximately $\pm 10\%$ (example: 4mV/V could be 3.6 to 4.4 mV/V). In multiple load cell applications such as batch systems and electronic truck scales, it is desirable for a customer to receive cells with a tighter band spread. With this option, outputs are standardized within $\pm 0.1\%$ of the nominal outputs shown in the catalog. (Example: 4 mV/V would be 3.996 mV/V to 4.004 mV/V).

As a result of the trimming operation, the input resistance of the load cell may be increased. A maximum input resistance on a 350 ohm bridge would not exceed 385 ohms. Compression cells are standardized in compression and universal cells are usually standardized in tension, although they can be standardized in compression on request. An INTERFACE base is required on Low Profile units with standardized outputs.

Shunt Calibration

A precision fixed resistor (R_{CAL}) placed across one leg of a load cell bridge causes an electrical unbalance which may be considered equivalent to a particular value of mechanical load. This "equivalent mechanical input" may be used for setting and checking an instrument or a system calibration without the necessity of applying a known mechanical load.

An R_{CAL} value approximating 73% of full scale is recorded and supplied for each low profile load cell. The user may duplicate this output by placing a like value resistor across the indicated terminals of the load cell.

The approximate value of shunt resistor which will simulate a particular mechanical load may be calculated, knowing the approximate output corresponding to the load, as follows:

$$R_{CAL} = \frac{25 R_B}{K \cdot X}$$

- Where R_{CAL} = Shunt resistor in Kohms
 R_B = Bridge resistance in ohms
 K = Rated output of cell in mV/V
 X = Load to be simulated,
 in % of Rated Capacity

Connector Options

Connector Protection for Low Profile™ Load Cells

The Connector Protection Option provides a rugged, anodized aluminum protector for Low Profile™ Load Cells fitted with the INTERFACE standard PC04E-10-6P connector or other common connectors. This option can be included on new load cells or can be factory installed on existing INTERFACE load cells.

Recognizing that the majority of load cell repairs involve damaged connectors, Interface encourages the use of this option.

Contact the factory for additional information on the specific Protector Model for your load cell.

Connector Protector

PT02E-10-6P Bayonet Connector

This option provides a bayonet style connector in place of the PC04E-10-6P threaded type connector which is standard on most Interface Low Profile™ Load Cells. Other connectors are available on request as special options.

**PC04E-10-6P
Standard Connector**

**MC-001
Mating Connector**

Interconnecting Cables

Interconnecting cables are available for use with INTERFACE load cells. Cables include a load cell mating connector on one end and pigtailed leads on the other. Standard length is 10 ft, but any length is available, in increments of 5 ft

SYSTEM INTERCONNECT CABLE PART NUMBERS

CT-101-xx* tension upscale (emulates integral cable)

CC-101-xx* compression upscale (for use with Junction Box in multi-cell weighing systems).

*xx indicates length in feet

Accessories

Mounting Plates for Low Profile™ Load Cells

The installation of a compression load cell under a weigh bridge, tank, or other structure normally requires that mounting plates be used. The bottom plate, ground flat to 0.0002 T.I.R. to mate with the load cell and fabricated of mild steel, distributes the load over the foundation or supporting structure and provides a prepared surface for the load cell.

The top plate distributes the load to the weighing structure and provides a hard (R_c45) surface for the load button. The top plate will move on the button due to thermal expansion, load shifting, wind loading, and other side loads. The high side load capacity of the INTERFACE load cell eliminates the requirement for expansion assemblies in most installations. Mounting plates are suitable for compression loads only; they will not properly support a universal load cell used in tension.

A load button may be installed in an INTERFACE universal load cell if it is used as a compression cell with the load applied by a plate or other flat surface.

For compression applications only, an INTERFACE compression load cell should usually be specified. Compression load cells are usually smaller, less expensive and have an integral load button.

Junction Boxes

In its most basic form a junction box provides a convenient method for wiring multiple load cells to a single indicator. Junction boxes are commonly used in weighing applications where a tank or scale is supported by more than one load cell. The individual load cell cables are wired into the junction box and then a single cable connects the junction box to the instrumentation.

The JB104SS is a small 4x6.5x1.75 inch stainless steel NEMA 4 rated box suitable for installations where space is limited. Standard configuration is for up to 4 load cells and provides three trim ranges; no trim, 10% and 30%. Spring clips are used for the load cell connections.

RCAL Resistors

RCAL RESISTORS

CABLE SPECIFICATION FOR ABOVE ASSEMBLIES

NOTE: "CT" prefix on cable assembly order numbers is for the most common polarity which is tension upscale. For compression upscale substitute "CC".

"-10" suffix on cable assembly part number is the most common cable length of 10 ft. Other lengths may be ordered by substituting the desired length in feet.

EXAMPLE: For a 20 ft cable to connect to a model 1221HL-50K transducer and have the convention of the green pigtail as + signal for a compression load, order CC-101-20.

*Call factory for more information.

Load Cell Terms & Definitions

This document defines the terminology and performance parameters pertaining to engineering specifications of load cell products. The objective of this terminology standard is to promote effective communication of specifications and to constitute a reference for uniformity. The definitions herein are generally compatible with common understanding in the load cell community and are an expansion of those found in "Load Cell Terminology and Test Procedure Recommendations," Third Edition, 1985, Scale Manufacturers Association, and in OIML International Recommendation R60, 1991 Edition. This document includes modifications to the definitions in the above referenced standards to correct some of their inconsistencies and inadequacies.

For convenience, terms which are defined in this standard are printed in upper case when used in the definition of another term.

AMBIENT TEMPERATURE

The temperature of the medium surrounding the LOAD CELL.

AXIAL LOAD

A load applied along the PRIMARY AXIS.

BAROMETRIC SENSITIVITY

The change in ZERO BALANCE due to a change in ambient barometric pressure. Normally expressed in units of %RO/atm.

CALIBRATION

The comparison of LOAD CELL OUTPUT against standard test loads.

CAPACITY

The maximum AXIAL LOAD a LOAD CELL is designed to measure within its specifications.

COMBINED ERROR

The maximum deviation of the CALIBRATION curve from the straight line drawn between MINIMUM LOAD OUTPUT and MAXIMUM LOAD OUTPUT, normally expressed in units of %FS. Both ascending and descending curves are considered.

CREEP

The change in LOAD CELL SIGNAL occurring with

time while under load and with all environmental conditions and other variables remaining constant. Normally expressed in units of % of applied load over a specified time interval. It is common for characterization to be measured with a constant load at or near CAPACITY.

CREEP RECOVERY

The change in LOAD CELL SIGNAL occurring with time immediately after removal of a load which had been applied for a specified time interval, environmental conditions and other variables remaining constant during the loaded and unloaded intervals. Normally expressed in units of % of applied load over a specified time interval. Normally the applied interval and the recovery interval are equal. It is common for characterization to be measured with a constant load at or near CAPACITY.

CREEP RETURN

The difference between LOAD CELL SIGNAL immediately after removal of a load which had been applied for a specified time interval, environmental conditions and other variables remaining constant during the loaded interval, and the SIGNAL before application of the load. Normally expressed in units of % of applied load over a specified time interval. It is common for characterization to be measured with a constant load at or near CAPACITY.

DEFLECTION ☑

The displacement of the point of AXIAL LOAD application in the PRIMARY AXIS between the MDL and MDL+CAPACITY load conditions.

ECCENTRIC LOAD

Any load applied parallel to but not concentric with the PRIMARY AXIS.

FULL SCALE or FS

The OUTPUT corresponding to MAXIMUM LOAD in any specific test or application.

HYSTERESIS

The algebraic difference between OUTPUT at a given load descending from MAXIMUM LOAD and OUTPUT at the same load ascending from MINIMUM LOAD. Normally expressed in units of %FS. It is common for characterization to be measured at 40-60% FS.

☑ See APPENDIX articles for more detailed information

INPUT RESISTANCE

The resistance of the LOAD CELL circuit measured at the excitation terminals with no load applied and with the output terminals open-circuited.

INSULATION RESISTANCE

The DC resistance measured between the bridge circuit and the case. Normally measured at 50 VDC.

LOAD CELL

A device which produces an OUTPUT proportional to an applied force load.

MAXIMUM AXIAL LOAD, SAFE

The maximum AXIAL LOAD which can be applied without producing a permanent shift in performance characteristics beyond those specified. Normally expressed in units of % CAPACITY.

MAXIMUM LOAD

The highest load in a specific test or application, which may be any load up to and including CAPACITY + MINIMUM LOAD, but may not exceed CAPACITY significantly.

MAXIMUM AXIAL LOAD, ULTIMATE

The maximum AXIAL LOAD which can be applied without producing a structural failure. Normally expressed in units of % CAPACITY.

MAXIMUM LOAD AXIS MOMENT, SAFE

The maximum moment with respect to the PRIMARY AXIS which can be applied without producing a permanent shift in performance characteristics beyond those specified.

MAXIMUM MOUNTING TORQUE, SAFE

The maximum torque which can be applied concentric with the primary axis without producing a permanent shift in performance characteristics beyond those specified.

MAXIMUM SIDE LOAD, SAFE

The maximum SIDE LOAD which can be applied without producing a permanent shift in performance characteristics beyond those specified.

MEASURING RANGE

The difference between MAXIMUM LOAD and MINIMUM LOAD in a specific test or application. It may not exceed CAPACITY.

MINIMUM DEAD LOAD or MDL

The smallest load for which specified performance will be met. It is normally equal to or near NO LOAD in single mode applications and is of necessity equal to NO LOAD in double mode applications.

MINIMUM LOAD

The lowest load in a specific test or application, differing from NO LOAD by the weight of fixtures and load receptors which are attached plus any intentional pre-load which is applied.

MODE

The direction of load. tension & compression are each one mode.

NATURAL FREQUENCY

The frequency of free oscillations under conditions of NO LOAD.

NO LOAD

The condition of the LOAD CELL when in its normal physical orientation, with no force input applied, and with no fixtures or load receptors attached.

NONLINEARITY

The algebraic difference between OUTPUT at a specific load and the corresponding point on the straight line drawn between MINIMUM LOAD and MAXIMUM LOAD. Normally expressed in units of %FS. It is common for characterization to be measured at 40-60 %FS.

NONREPEATABILITY

The maximum difference between OUTPUT readings for repeated loadings under identical loading and environmental conditions. Normally expressed in units of %RO.

OUTPUT

The algebraic difference between the SIGNAL at applied load and the SIGNAL at MINIMUM LOAD.

OUTPUT RESISTANCE

The resistance of the LOAD CELL circuit measured at the SIGNAL terminals with no load applied and with the excitation terminals open-circuited.

PRIMARY AXIS

The axis along which the LOAD CELL is designed to be loaded.

See APPENDIX articles for more detailed information

Load Cell Terms & Definitions, Continued

RATED OUTPUT or RO

The OUTPUT corresponding to CAPACITY, equal to the algebraic difference between the SIGNAL at (MINIMUM LOAD + CAPACITY) and the SIGNAL at MINIMUM LOAD.

RESOLUTION

The smallest change in load which produces a detectable change in the SIGNAL.

SHUNT CALIBRATION

Electrical simulation of OUTPUT by connection of shunt resistors of known values at appropriate points in the circuitry.

SIDE LOAD

Any load at the point of AXIAL LOAD application acting at 90° to the PRIMARY AXIS.

SIGNAL

The absolute level of the measurable quantity into which a force input is converted.

SPAN

Another name for RATED OUTPUT.

STATIC ERROR BAND or SEB

The band of maximum deviations of the ascending and descending calibration points from a best fit line through zero OUTPUT. It includes the effects of NONLINEARITY, HYSTERESIS, and non-return to MINIMUM LOAD. Normally expressed in units of %FS.

SEB OUTPUT

A computed value for OUTPUT at CAPACITY derived from a line best fit to the actual ascending and descending calibration points and through zero OUTPUT.

SYMMETRY ERROR

The algebraic difference between the RATED OUTPUT in tension and the average of the absolute values of RATED OUTPUT in tension and RATED OUTPUT in compression. Normally expressed in units of %RO.

TEMPERATURE EFFECT ON OUTPUT

The change in OUTPUT due to a change in AMBIENT TEMPERATURE. Normally expressed as the slope of a chord spanning the COMPENSATED TEMPERATURE RANGE and in units of %/°F or %/100°F.

TEMPERATURE EFFECT ON ZERO

The change in ZERO BALANCE due to a change in AMBIENT TEMPERATURE. Normally expressed as the slope of a chord spanning the COMPENSATED TEMPERATURE RANGE and in units of %RO/°F or %RO/100°F.

TEMPERATURE RANGE, COMPENSATED

The range of temperature over which the LOAD CELL is compensated to maintain OUTPUT and ZERO BALANCE within specified limits.

TEMPERATURE RANGE, OPERATING

The extremes of AMBIENT TEMPERATURE within which the LOAD CELL will operate without permanent adverse change to any of its performance characteristics.

TOGGLE

Another name for ZERO FLOAT.

ZERO BALANCE

The SIGNAL of the LOAD CELL in the NO LOAD condition.

ZERO DEAD BAND

Another name for ZERO FLOAT.

ZERO FLOAT

The shift in ZERO BALANCE resulting from a complete cycle of equal tension & compression loads. Normally expressed in units of %FS and usually characterized at FS = CAPACITY.

ZERO STABILITY

The degree to which ZERO BALANCE is maintained over a specified period of time with all environmental conditions, loading history, and other variables remaining constant.

See APPENDIX articles for more detailed information

Troubleshooting Guide for Interface Load Cells

1. INTRODUCTION

Performance of a load cell force (or weigh) measurement system is dependent upon the integrity of the physical installation, correct interconnection of the components, proper performance of the basic components which make up the system, and calibration of the system. Presuming that the installation was originally operating and was calibrated, troubleshooting can begin by checking the components individually to determine if they have been damaged or have failed. The basic components are:

- Load cells
- Mechanical supports and load connections
- Interconnecting cables
- Junction boxes
- Signal conditioning electronics

1.1 Mechanical Installation

Load Cells which are not mounted in accordance with the manufacturer's recommendations may not perform to manufacturer's specifications. It is always worthwhile to check:

- Mounting surfaces for cleanliness, flatness, and alignment
- Torque of all mounting hardware
- Load cell orientation: "Dead" end on mechanical reference or load forcing source, "live" end connected to the load to be measured. (Dead end is the end closest mechanically to the cable exit or connector.)
- Proper hardware (thread sizes, jam nuts, swivels, etc) as required to connect the load to the load cell.

A fundamental requirement is that there be one, and only one load path! This load path must be through the load axis of the load cell. This may sound elementary, however it is a commonly overlooked problem.

1.2 Electrical Installation:

Proper load cell performance is also dependent upon the electrical "system." The following items are common problem areas:

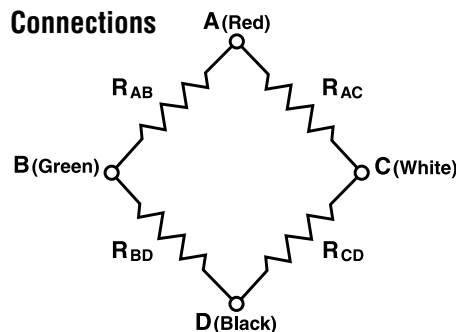

- Loose or dirty electrical connections, or incorrect connection of color coded wires.
- Failure to make use of remote sensing of excitation voltage on long cables.
- Incorrect setting of excitation voltage. (The best setting is 10 VDC, because that voltage is used to calibrate the load cell in the factory. The maximum voltage allowed is 15 or 20 volts, depending on the model. Some battery-operated signal conditioners use smaller voltages, down to 1.25 volts, to conserve battery power.)
- Loading of the bridge circuit. (Highly accurate load cell systems require highly accurate read-out instruments. Such instruments typically have very high input impedances to avoid circuit loading errors.)

2. LOAD CELL EVALUATIONS

It is quite easy to make a quick diagnostic check of a load cell. The procedure is quite simple and a minimum of equipment is required. Should it be determined that the load cell is at fault, the unit should be returned to the factory for further evaluation and repair as may be required. Many of the checks may be performed with an ohmmeter.

2.1 Check Bridge Circuitry and Zero Balance. (Numbers apply to standard 350 ohm bridges.)

Typical Connections

- Instrument required: Ohmmeter with 0.1 ohms resolution in the range of 250-400 ohms.
- Bridge Input Resistance: R_{AD} should be 350 ± 3.5 ohms (unless the cell has “standardized output,” in which case the resistance should be less than 390 ohms)
- Bridge Output Resistance: R_{BC} should be 350 ± 3.5 ohms
- Bridge Leg Resistances: Comparing the leg resistances at no load permits evaluation of the cause of any permanent damage in the load cell flexure. The “computed unbalance” of the bridge shows the general condition of the cell.
- The computed unbalance, in units of “mV/V,” is determined as follows:
Unbalance = $1.4 \cdot (R_{AC} - R_{AB} + R_{BD} - R_{CD})$
- The Zero Offset, in units of “% of Rated Output”, is determined as follows:
Zero Offset = $100 \cdot \text{Unbalance} \div \text{Rated Output}$

If the ohmmeter resolution is 0.1 ohm or better, then a computed Zero Offset of greater than 20 percent is a clear indication of overload. A computed zero balance of 10-20% is an indication of probable overload.

If the load cell has been overloaded, mechanical damage has been done that is not repairable, because overloading results in permanent deformation within the flexural element and gages, destroying the carefully balanced processing that results in performance to Interface specifications. While it is possible to electrically re-zero a load cell following overload, it is not recommended because this does nothing to restore the affected performance parameters or the degradation to structural integrity.

If the degree of overload is not severe the cell may in some cases be used at the user’s discretion, although some performance parameters may violate specifications and the cyclic life of the load cell may be reduced.

2.2 Insulation Resistance Tests

- Insulation resistance, shield to conductors: Connect all the conductors together, and measure the resistance between all those wires and the shield in the cable.
- Insulation resistance, load cell flexure to conductors: Connect all the conductors together, and measure the resistance between all those wires and the metal body of the load cell.

The tests described above can be performed using a standard ohm meter, although best results are obtained with a megohm meter. If resistance is beyond the standard ohmmeter range, about 10 megohms, the cell is probably OK. However, some kinds of electrical shorts show up only when using a megohm meter or with voltages higher than most ohmmeters can supply.

CAUTION

Never use a voltage higher than 50 VDC or 35 VRMS AC to measure insulation resistance, or breakdown of the insulation between the gages and the flexure may result.

Low resistance (below 5000 megohms) is often caused by moisture or pinched wires. The cause and extent of damage must be established at the factory to determine if the load cell may be salvaged.

3. FACTORY EVALUATION

If the load cell is defective for reasons other than overload, return to factory for detailed evaluation. Factory evaluation may show that the cell is repairable or non-repairable and if repair or replacement will be under warranty. If non-warranty, the customer will be contacted with the cost of repairs and recalibration, and a delivery date after receipt of authorization to proceed.

Load Cell Fatigue Theory

BACKGROUND

Interface has specialized in fatigue-rated load cells and their applications since its founding in 1968. Fatigue rating is a distinct specification which guarantees the customer a load cell which has a service life of 100 million fully reversed loading cycles at full rated capacity.

The very first products at Interface were fatigue-rated load cells, and over the years a history has been built up by thousands of cells in use all over the world. Many have been supplied to major manufacturers of materials test machines and to major aerospace manufacturers, for use in long term structural fatigue test programs on aircraft, space, and automotive equipment. **No fatigue failure of any fatigue-rated Interface load cell, used within its ratings, has ever been reported.**

FATIGUE FAILURE THEORY

It is well known that metals will fail in a statically loaded situation if the yield strength is exceeded. Inasmuch as load cells are structural members which are stressed in the course of their normal use, they are commonly given "ultimate overload" ratings in an effort to characterize the magnitude of static load they will withstand without failing structurally.

However, all metal structures, including load cells, are also subject to failure as a result of repetitive loadings which are much lower than the ultimate overload rating. This phenomenon is known as a fatigue failure, and it is due to the fact that the stress which a metal can withstand under cyclic loading usually becomes less and less as the number of cyclic loadings is increased.

The cause of this apparent anomaly can be explained by noting that metals are typically not perfectly homogeneous solids. They are composed of crystals, and at locations called grain boundaries, along slip planes or in a region of a microscopic

defect there can be minute strains under load which do not completely reverse during unload, leaving the material with a slight plastic deformation at the end of each complete cycle. This effect is highly dependent on the magnitude of the load and the number of cycles.

ANATOMY OF A FATIGUE FAILURE

It is generally acknowledged that a structural fatigue failure develops in three stages:

1. Repeated cycling builds up local plastic deformation, and a microscopic crack is initiated.
2. The crack propagates and a larger section becomes weakened.
3. Stress concentration in the section of cracking increases rapidly, and continued cycling enlarges the crack until sudden fracture occurs.

FATIGUE LIFE PREDICTION

Accurate prediction of fatigue life of any structure is not a reality. Well controlled tests on the most simple configurations of test specimens result in a wide scatter band of results. With complex structures typical of a load cell, analysis is even more complex. Theoretical analysis can produce approximations, however, which can be useful in estimating the margin of safety at which a particular load cell design is operating.

In materials science, the S-N curve is a well known tool. It is a graphical representation of the number of load cycles required to break a specimen, at a range of peak cyclic stress levels. S-N curves for the high quality materials used in Interface load cells have been experimentally determined, and are shown in Figure 1 for stainless steel and alloy steel, and in Figure 2 for aluminum alloy.

Thus, if the stress level is known, the fatigue life can be approximately known. However, there are factors which make fatigue life difficult to characterize.

Such factors include the shape of the loading curve, the frequency of the load cycling, residual stresses, stress concentrations due to material shape, state of stress, material condition, size, fabrication method, surface finish, corrosion, operating temperature, and operating atmosphere.

LOAD CELL FATIGUE FAILURE MODES

COMPONENTS SUBJECT TO FAILURE

There are two metal components in a load cell that must be considered in fatigue analysis, the flexure (spring element) and the strain gage (sensor).

1. The flexure bears the load; therefore failure of the flexure is structural.
2. Since the gages' function is electrical measurement of minute deflections, failure of the strain gages, on the other hand, is typically not structural; failure is noted by a shift in resistance or gage factor.

The relative propensity to first encounter flexure or strain gage fatigue failure depends upon the design of the transducer.

FLEXURES

There are several metals used for flexures in Interface load cells including aircraft quality alloy steel, stainless steel, and high strength fatigue-resistant aluminum alloy. S-N curves for these three materials are presented in Figure 1 and Figure 2.

Stress is normally expressed in units of psi (pounds per square inch), but for convenience we use units of KSI which are equal to 1000 psi. Shear stress is on the vertical axis, corresponding to the state of stress in Low Profile load cells. Readers with some materials science familiarity will recognize that classical fatigue strength for these materials is higher than indicated in the figures. This is because classical data is for bending or direct stress, whereas Interface fatigue-rated cells operate in shear mode. This analysis therefore appropriately uses the required factor for shear, avoiding a falsely optimistic result.

Note that the shear S-N curve for steel becomes essentially flat at about 55 KSI. This is a characteristic of steel. The stress level at the flat portion of the curve is called the **endurance limit**. If operated below this limit, theoretically the material will endure an infinite number of load cycles. Nonferrous metals do not generally exhibit an endurance limit, their curves continuing on with a small slope.

FIG. 1 S-N CURVE, INTERFACE ALLOY STEEL AND STAINLESS STEEL

FIG. 2 S-N CURVE, INTERFACE ALUMINUM

Load Cell Fatigue, Continued

GAGES

Interface strain gages are specially made of fatigue-resistant nickel-chromium alloy. Strain gage fatigue characteristics are most conveniently viewed in terms of strain rather than stress. Figure 3 shows a Strain-N curve for Interface strain gage material. Strain is a dimensionless quantity of normally very small magnitude. The microstrain unit is simply 106 strain units and is used for convenience. Stress and strain for any particular material are related by a constant which is the modulus of elasticity (30X106 for steel and 10X106 for aluminum), allowing convenient comparison of S-N curves and Strain-N curves.

NOTE

The curves in Figures 1, 2 and 3 are for fully reversed load cycles, meaning that for 2000 microstrain as an example, a cycle starts at zero load and consists of one load to (+2000), one load to (-2000), with a return to zero.

FIG. 3 STRAIN-N CURVE, INTERFACE STRAIN GAGES

COMPARISON OF LOADING LEVELS

Superimposed on the curves are operating levels of Interface Low Profile load cells by model series. This provides a convenient visualization of the fact that all of these load cells are designed to have very long, if not infinite, theoretical fatigue lives. Remember that in actual practice things are not necessarily so ideal. Therefore, in order to establish the correlation between theoretical and realizable fatigue life, actual test results are desirable.

DESIGN VERIFICATION TESTS

TEST PROTOCOL

Interface conducted Design Verification Tests to substantiate the theoretical life predictions by means of actual load tests of the product. Obviously, building up millions of load cycles on a high capacity load cell is not a trivial task. Many hours of costly machine time are required. Tests were conducted on three representative Interface Low Profile load cells: (1) an aluminum cell of 5,500 lbf capacity, (2) a steel cell of 11,000 lbf capacity, and (3) a steel cell of 22,000 lbf capacity.

Loading to 130% of rating was selected as an acceleration factor, to bring down the test time to a realizable length, since 100 million cycles at 1 hertz and 100% loading would consume 3 years and 2 months of testing, 24 hours per day. Based on the slopes of the S-N curves, a cycle acceleration factor of at least 10 can be achieved with 130% loading, thus ensuring that the more stringent test at 10⁷ cycles will prove a fatigue life of 10⁸ cycles at 100% loading.

TEST RESULTS

Analysis of the test data showed that there were no indications of fatigue failure nor degradation of load cell performance outside specified limits, for the critical load cell parameters of output, zero balance, nonlinearity, hysteresis, and creep, during or after completion of the Verification Test program.

BENEFITS OF REDUCED STRESS LEVELS

LOWER STRESS BY DESIGN

Interface load cells are designed for optimum fatigue life. Other load cells are not necessarily equivalent. Table 1 is a comparison of actual strain levels in Low Profile™ and typical competitive load cells. The safety factors are a means of visualizing the design merit of the various designs. The value of fatigue rated load cells for fatigue applications is evident from the safety factor data. It is also apparent that Interface load cells with 4 mV/V output have lower stress levels and, therefore, more fatigue resistance than competitors' cells, even though their output is only 3 mV/V or less.

LOWER STRESS, BY USER LIMITS

Note that the tests and S-N curves are based on fully reversed load cycles. This type of loading cycle is considerably more stringent than unidirectional loading, which is the more common application of load cells. If a fatigue load cell is repeatedly loaded in only one direction, the Goodman Law predicts that it can be loaded to about 133% of the bidirectional fatigue-rated capacity with no degradation of its fatigue rating. Conversely, unidirectional loading to a fatigue cell's rated capacity is much less stressful on the cell than bidirectional loading and can be expected to yield a fatigue life well beyond the number of cycles which could be reasonably and economically applied in a verification test program.

TABLE 1. Low Profile Load Cell Strain and Safety Factor Comparison

Design Characteristic	Interface 1000 Series (Fatigue)	Interface 1000 Series (Fatigue)	Interface 1100 Series 1200 Series	Interface 1100 Series 1200 Series 3200 Series 4200 Series 4600 Series	Competition Generic Load Cell
	Aluminum	Steel	Aluminum	Steel	Steel
Output, mV/V	1	2	2	4	3
Fatigue Life Rating (Cycles)	10 ⁸	10 ⁸			?
Microstrain at Rated Capacity	450	900	900	1800	1790 (1)
Max Microstrain on Flexure allowed for 10 ⁸ Cycle Life	1400	1850	1400	1850	1850
Max Microstrain on Gages allowed for 10 ⁸ Cycle Life	2000	2000	2000	2000	1400 (2)
Safety Factor, Flexure (Ratio allowed/actual strain)	3.1	2.1	1.6	1.0	1.0
Safety Factor, Gages (Ratio allowed/actual strain)	4.4	2.2	2.2	1.1	0.8

NOTES: (1) In typical competitors' load cells, the copper-nickel alloy gages have approximately 20% lower Gage Factor than interface gages and lose approximately 10% of their natural output to temperature compensation circuitry, a loss which is not present with Interface self-compensated gages. The result is that generic 3 mV/V load cells are stressed about equally with Interface 4 mV/V load cells.

(2) Typical copper-nickel alloy gages have approximately 70% of the fatigue resistance of Interface nickel-chromium alloy gages.

Load Cell Resolution

INTERFACE Load Cells are constructed using electric resistance metal foil strain gages bonded to an elastic flexure element. The load cell is a passive analog device with continuous resolution limited ultimately by noise, due to electron motion on the order of 10⁻⁹ volts (1 nanovolt). Therefore, practically speaking, resolution is limited by the type and quality of the electronic instrumentation used, rather than by the load cell itself. Many reasonably priced instruments can resolve 0.8 to 1.0 microvolt/count as a minimum signal level.

For example, consider a load cell with Rated Output of 3mV/V. Assume that 10VDC excitation is used. At Rated Output, the signal level produced would be:

$$3 \text{ mV/V} \times 10 \text{ V} = 30 \text{ mV}$$

If the indicating instrument can resolve 1 microvolt in the rightmost digit of the display, then:

$$\begin{aligned} \text{Resolution} &= \frac{1 \text{ } \mu\text{volt}}{30 \text{ mV}} \\ &= \frac{1 \text{ } \mu\text{volt}}{30,000 \text{ } \mu\text{volt}} \\ &= 0.000033, \text{ fraction of Rated Output} \\ &= 0.0033 \% \text{ of Rated Output} \end{aligned}$$

If, for example, an MB-5 (5 lbf Rated Capacity) load cell were being used, the resolution in pounds could be calculated as:

$$\begin{aligned} \text{Resolution} &= 5 \text{ lbf} \times 0.000033 \\ &= 0.00017 \text{ lbf} \end{aligned}$$

If an instrument capable of 0.5 microvolt resolution were used, the resolution would be approximately 1 part in 60,000 or 0.000083 pounds for the 5 pound capacity cell. Maximum resolution may be limited by the instrument to the total number of counts that can be displayed.

Another typical example would be the case where only a portion of the range of the load cell is to be used. If the maximum load on the MB-5 were to be 3 pounds, then the output would be:

$$\begin{aligned} 3 \text{ mV/V} \times 3 \text{ lbf} / 5 \text{ lbf} &= \\ 1.8 \text{ mV/V} & \end{aligned}$$

Using 10V excitation provides a signal of 18 mV output for 3 pounds input. If the instrument displays is to display 30,000 counts a signal strength of

$$\begin{aligned} 18 \text{ mV} / 30,000 \text{ counts} &= \\ 0.6 \text{ microvolt/count} & \end{aligned}$$

results in a display of 0.00015 pound/count resolution. Of course, the instrument must have a sensitivity of at least 0.6 μ volt/count for this example.

It can be seen from the above examples that the sensitivity and stability of the electronic instrumentation is critical, when high resolution is required. High electronic gain alone will not achieve good results if the zero stability or gain stability is poor because the readings will drift with time or temperature changes.

Also, keep in mind that excessive resolution can be detrimental in situations where the stability of the applied force is low, as in some hydraulic systems.

Generally, it is desired to read physical units instead of counts. Most instruments provide a count-by feature of 1, 2, 5 or 10 to facilitate this. For the above example, an instrument could be set up to read 30,000 counts by 2 for the 3 pound load, providing resolution of 0.0002 lbf Premium instruments are available that offer as good as 0.001 μ volt/count.

Grounding and Shielding in Load Cell Installations

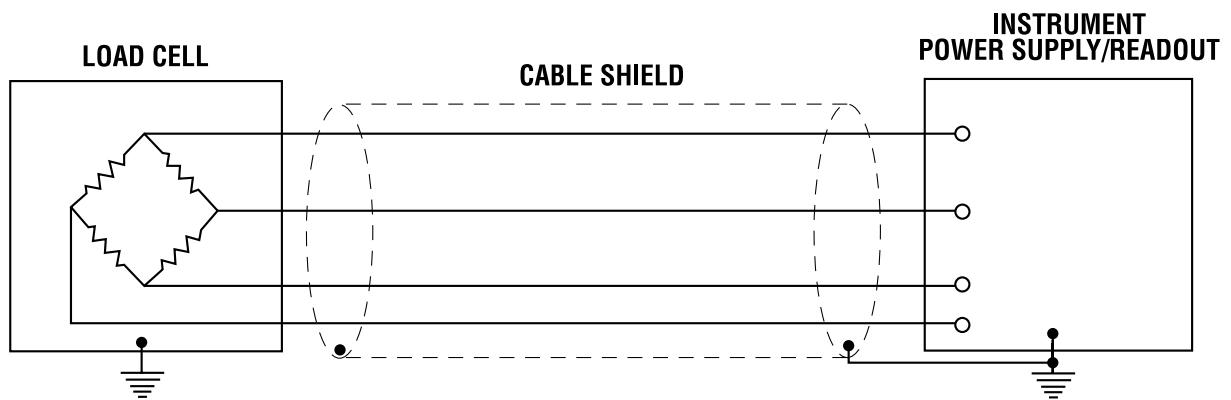

Proper grounding and shielding can be critical to the successful application of load cells generating low level signals. There is no “best way” to set up all systems and the specifics of the installation and associated instrumentation must be considered in arriving at a system configuration that is satisfactory.

The basic rule that should not be violated is that continuous ground loops should be avoided, i.e., a system should not be grounded at multiple points. This could occur, for example, if the shield of the load cell cable were grounded at both ends.

Interface load cell cables are supplied with a braided shield which provides protection from electrostatic interference when properly grounded. This shield is floating (not connected) at the load cell end so that a “ground loop” will not be inadvertently created.

A basic system layout that is easily achieved and usually is satisfactory is as follows:

The load cell case is grounded by mechanical attachment to the structure to which it is mounted. This structure should be properly grounded to the electrical circuits which drive the excitation for the load cell. The braided shield enclosing the load cell leads is grounded at the instrument and the instrument is grounded through the power cord.

Excitation Voltage

INTRODUCTION

Unless otherwise specified, all Interface load cells are calibrated with an excitation voltage of 10 VDC. Although Low Profile™ cells may be operated with excitation as high as 20 VDC, and Mini Series cells can be excited with up to 15 VDC, it is always best to operate a load cell at the same voltage used for the calibration, because certain parameters of the cell are affected by the applied voltage.

The basic construction of a load cell consists of strain gages bonded to a flexure inside the load cell with a very thin layer of an electrically insulating epoxy. Typically, four gages are connected together in a bridge circuit. When voltage is applied to the bridge, the current through the each gage generates heat, which is conducted through the epoxy into the larger mass of the flexure. Thus, the temperature of the bridge is always slightly higher than the flexure during normal operation.

GAGE HEATING

Each 350 ohm leg of a bridge will dissipate over 71 milliwatts at 10 VDC excitation. Since power is proportional to the square of the voltage, the leg would be dissipating over a quarter of a watt at 20 VDC, but only 18 milliwatts at 5 VDC.

ZERO BALANCE

Slight differences in the temperature coefficient of resistance in each leg of a bridge will cause the zero balance to shift slightly as the gage temperature changes. The effect is usually small. For example, a change of excitation from 10.00 VDC to 10.25 VDC will cause a zero shift of less than 0.0014% of rated output.

SENSITIVITY

The gage factor of each gage is adjusted so as to compensate for the temperature coefficient of the modulus of the flexure. This matching is exactly valid only at an excitation of 10 VDC. An increase of excitation voltage to 10.25 VDC would lower the bridge sensitivity by only 0.001%, but use of 20 VDC would cause the sensitivity of a Low Profile cell to decrease by 0.07%, which could be significant. 20 VDC applied to Mini Series cell would cause a more serious effect due to gage heating, and could possibly even shorten the life of the cell.

CREEP

Creep is influenced by temperature, but the magnitude and direction of the effect of large changes in applied voltage is not predictable.

At room temperature, changing the applied voltage from 10.00 VDC to 10.25 VDC causes a negligible effect. However, increasing the voltage on a Low Profile cell to 20 VDC could cause the creep to increase (or decrease) by less than 10% of the creep specification.

CONCLUSION

Because of the inherent temperature stability of the design of Interface load cells, reasonable shifts in excitation voltage will result in parametric shifts which would not be detectable in most normal applications.

However, in applications where the load cell is to be used as a transfer standard, or where the stability of the cell's characteristics is necessary, precautions should be used to assure the stability of the excitation voltage.

Moment Compensation

Do you know if you have an accurate force reading? In most applications it is difficult, if not impossible, to calculate or even estimate the effect of misalignments on the precision of a force measurement system. Moment sensitivity introduces errors into force measurements whenever forces cannot be applied precisely on-axis.

The Low Profile™ design by Interface has the intrinsic capability of canceling moment loads because of its radial design.

- The radial flexure beams are precision machined to balance the on-axis loading.
- The gages are precisely placed so that strains due to on-axis loads are additive and strains due to moment loads tend to cancel under actual moment loading.
- Interface uses eight gages, as opposed to the four used by many manufacturers, which helps to further minimize error from the loads not being perfectly aligned.
- Slight discrepancies between gage outputs are carefully measured and each load cell is adjusted to further reduce extraneous load sensitivity, to meet the specifications in the table below.

SERIES	S	M	T	Max Error Due To S or M (% Rated Range)
	Max Side Force (% Rated Range)	Max Moment (% Rated Range x 1 inch)	Max Torque (% Rated Range x 1 inch)	
1000	100%	100%	100%	0.10%
1100	40%	40%	40%	0.04%
1200	40%	40%	40%	0.10%
1500	40%	40%	60 in-lb	0.10%
1600	40%	40%	40%	0.04%
1800	100%	100%	100%	0.05%

RESISTANCE TO EXTRANEOUS LOADS

The INTERFACE Low Profile™ design provides optimum resistance to extraneous loads to insure maximum operation life and minimize reading errors. The above chart tabulates maximum allowable extraneous loads that may be applied singularly without electrical or mechanical damage to the cell and the maximum error that can be expected from side forces or bending moments. Several loads can be tolerated simultaneously if the total combined load is not more than 100% of the allowable maximum extraneous load.

Only Interface guarantees maximum extraneous load error and physically adjusts every load cell.

The Interface 1200 Series cells have eccentric load sensitivity less than $\pm 0.25\%$ of reading per inch, and the 1000, 1100, and 1600 Series are further adjusted to come in at less than $\pm 0.1\%$ of reading per inch. Most competing load cells will have extraneous load error ten, or more, times higher than with a superior Interface load cell.

Temperature Compensation of Zero

THE ADVANTAGES OF FULL TEMPERATURE RANGE COMPENSATION

Temperature compensation of zero balance of load cells is conventionally performed using the chord-slope method. A partial-range implementation of this method, acting on a chord between room temperature and one extreme temperature is often used. A better implementation is full-range using three test temperatures and acts on a chord between the cold and hot extremes.

The top curve on the plot represents the zero temperature characteristics of an uncompensated load cell. This curve would ideally be a straight line but often has some nonlinearity such as shown here. The objective of the compensation process is to rotate the curve to a more level position. The middle curve represents a compensation based on room temperature (T_r) and hot temperature (T_h) and is consequently labeled "r-h compensated." The process equalizes the zero balance values at T_r and T_h .

The lower curve represents a compensation based on cold temperature (T_c) and hot temperature (T_h) and is labeled "c-h compensated." This process equalizes the zero balance values at T_c and T_h , producing a relatively full-range solution.

It is now apparent why the full range procedure (lower curve) is superior:

1. The slope of the characteristic near room temperature, the temperature at which most applications are of most interest, is near zero.
2. The total range of zero balance over the temperature range of the plot is minimal, approximately one-half that of the partial-range compensated curve in this example.

Instrument Calibration Using a Shunt Calibration Resistor

INTRODUCTION

Since a strain gage load cell is a passive electrical device, there exists a simple, yet effective, method for checking the calibration of a load cell system in the field or when a means of applying actual forces is unavailable. Inducing an electrical imbalance in the cell's bridge circuit will simulate the bridge imbalance caused by the application of actual forces to the load cell. Then the system gain may be adjusted so that the system output signal or display indicates a known force on the load cell.

NOTE

Be careful not to use Shunt Calibration as a substitute for actual force calibration of a system. Shunt Calibration merely supplies a known signal to the signal conditioning unit, in order to check its gain or span adjustment.

EQUIVALENT FORCE

On the Calibration Certificate for each Low Profile load cell, Interface routinely supplies the value of the equivalent force resulting from connecting a specified shunt calibration resistor across one leg of the bridge. For other types of cells, Interface will supply shunt calibration values on special request.

SHUNT CALIBRATION CONNECTIONS

The standard connections used by Interface for tension & compression shunt calibration are specified on the Calibration Certification for each load cell.

It is important that the standard connection be used, although a similar (but not equal) output would result from connecting to the opposite leg of the bridge. Shunt calibration is relatively insensitive to small changes in temperature, although the calibration is precisely correct only at the "Lab Standard" conditions noted on the load cell's Calibration Certificate.

RESISTOR VALUES

The following values of shunt resistors will cause an output of approximately 73% of Rated Output for the load cell types indicated when connected across the specified load cell terminals.

For 4 mV/V cells:

RS-100-30K (30,000 ohms, $\pm 0.01\%$)

For 3 mV/V cells:

RS-100-40K (40,000 ohms, $\pm 0.01\%$)

For 2 mV/V cells:

RS-100-60K (60,000 ohms, $\pm 0.01\%$)

For 1 mV/V cells:

RS-100-120K (120,000 ohms, $\pm 0.01\%$)

PROCEDURE

To perform a shunt calibration, use the following procedure:

1. Remove or stabilize all forces on the load cell.
2. Adjust the display or indicator ZERO to read exactly zero.
3. Connect the shunt calibration resistor to the terminals specified on the Calibration Certificate, and adjust the SPAN or GAIN until the display reads the force value stated on the Certificate.
4. Repeat the procedure to insure a valid calibration.

Load Cell Performance as Affected by Cable Length

INTRODUCTION

For high accuracy force measurement the effects of the cable on the measurement must be considered. For constant voltage excitation there are two effects of significance. These are:

1. An effect on the sensitivity due to voltage drops over the cable length.
2. An effect on the thermal span characteristics of the load cell due to the change of cable resistance with temperature.

CABLE LENGTH EFFECTS

If the load cell is sold with a cable of any length, the sensitivity is determined with the installed cable in calibration and this is not a problem. For load cells with connectors, or if the customer adds cable himself, there will be a loss of sensitivity of approximately 0.37% per 10 feet of 28 gage cable and .09% per 10 feet of 22 gage cable. This error can be eliminated if a six wire cable is run to the end of the load cell cable or connector and used in conjunction with an indicator that has sense lead capability.

TEMPERATURE EFFECTS

Since cable resistance is a function of temperature, the cable response to temperature change affects the thermal span characteristics of the load cell/cable system. For 6-wire systems this effect is eliminated. For 4-wire cables the effect is compensated for in the standard cable lengths offered with the load cells if the load cell and cable are at the same temperature at the same time. For non-standard cable lengths, there will be an effect on thermal span performance. The effect of adding 10 feet of 28 gage cable is to cause a decrease in sensitivity with temperature equal to 0.0008%/°F (an amount equal to the standard Interface specification). For an added 10 feet of 22 gage cable the effect is to decrease sensitivity by .0002%/°F (one-fourth Interface spec). In many cases a customer can tolerate the degraded performance since our standard specification is extremely tight. However, for long cable runs or high accuracy applications, this can be a significant factor. In such cases, the best approach to the problem is to run six wires to the end of the standard cable length and sense the excitation voltage at that point. This eliminates the problem.

Proprietary Interface Strain Gages

UNIQUE FORMULATION, MADE IN-HOUSE

Interface load cells are constructed with strain gages manufactured by Interface from a unique proprietary alloy which provides inherently temperature compensated output. They are manufactured in our facility, in order to provide the necessary strict control of the formulation and the forming process.

MATCHED TEMPERATURE CHARACTERISTICS

The temperature characteristic of the strain gages is adjusted by special processes to exactly match and counteract the temperature characteristic of the modulus of the load cell structural material, thereby providing output which is relatively temperature insensitive. The bridge circuit is simple, reliability is high, and changes in output sensitivity caused by temperature variations are automatically compensated.

By contrast, competitive load cells use strain gage alloys which require the addition of temperature-sensitive resistors in the bridge circuit for compensation, thus reducing reliability. Since the resistors aren't in intimate thermal contact with the cell's flexure, the dynamic thermal performance, resistance to thermal gradients, and thermal response times are also severely affected.

LONGER FATIGUE LIFE

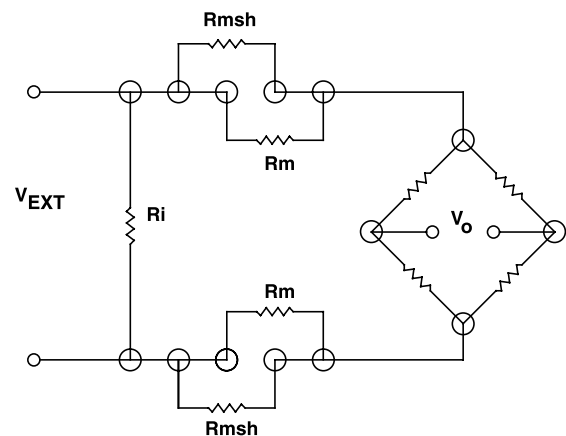

The Interface strain gage alloy provides significantly greater fatigue life than the widely-used constantan gages used by the competition.

HIGHER OUTPUT

A third advantage of the Interface strain gage is higher output, providing higher signal-to-noise ratio and opportunity for higher resolution in precision measurement applications.

Warranty & Repair Policy

WARRANTY

1. Interface warrants that its products shall be free from defects in material and workmanship for the full warranty period under normal and proper use when correctly installed. The warranty period for most load cells is two years and for other products is one year, from date of shipment by Interface.
2. Any Interface product, which proves defective in material or in workmanship within the warranty period, will be repaired or replaced free of charge provided that the buyer; (1) provides Interface with satisfactory proof of the defect and that the product was properly installed, maintained and operated within the limits of rated and normal usage; (2) buyer obtains from Interface authorization to return the product; and (3) products claimed to be defective must be returned with transportation charges prepaid, and will be returned to buyer with transportation charges collect unless the item is found to be defective, in which case, Interface will pay the return transportation charges.
3. The remedy set forth herein does not apply to damage to or defects in any product caused by the buyer's misuse or neglect, nor does it apply to any product which has been repaired or disassembled which in the sole judgement of Interface affects the performance of the product.
4. Interface makes no warranty concerning components not manufactured by it. However, in the event of the failure of any component or accessory not manufactured by Interface, reasonable assistance will be given to buyer in obtaining from the respective manufacturer whatever adjustment is reasonable based on the manufacturer's own warranty.
5. Interface expressly disclaims any liability to its customers, dealers, and representatives, and to users of its products, and to any other person for special or consequential damages of any kind and from any cause whatsoever arising out of or in any way connected with the manufacture, sale, handling, repair, maintenance, or replacement arising out of or in any way connected with the use of Interface products.
6. Representations and warranties made by any person, including dealers and representatives of Interface, which are inconsistent or in conflict with the terms of this warranty (including but not limited to the limitations of the liability of Interface, as set forth above), shall not be binding upon Interface unless reduce to writing and approve by an officer of Interface, Inc.

THIS EXPRESS WARRANTY SUPERCEDES ANY AND ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING IMPLIED WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

OBTAINING SERVICE UNDER WARRANTY

Advance authorization is required before any product is returned to Interface. Prior to the return of any product, write or call the Repair Department at Interface advising them of; (1) a part number; (2) a serial number of the defective product; (3) a technical description of the defect including specific test data, written observations on the failure and specific corrective action required; (4) a no-charge purchase order number (so the product can be returned to sender correctly); and (5) ship and bill addresses. Non-verified problems or defects may be subject to an evaluation charge. Please return the original calibration data with the unit.

REPAIR WARRANTY

All repairs of Interface products are warranted for a period of 90 days from date of shipment. This warranty applies only to those items which were found defective and repaired; it does not apply to products in which no defect was found and returned as is or merely recalibrated. Out of warranty products may not be capable of being returned to the exact original specifications.

INSIDE BACK COVER
