Vertical Multistage Electric Pumps

SV Series with high efficiency PLM motors

MARKET SECTORS

CIVIL, AGRICULTURAL, LIGHT INDUSTRY, WATER TREATMENT, HEATING AND AIR CONDITIONING.

APPLICATIONS

- Handling of water, free of suspended solids, in the civil, industrial and agricultural sectors.
- Pressure boosting and water supply systems.
- Irrigation systems.
- Wash systems.
- Water treatment plants.
- Handling of moderately aggressive liquids, demineralized water, water and glycol, etc.
 - Circulation of hot and cold water for heating, cooling and conditioning systems.
 - Boliler feed.
- Tested in compliance with ISO 9906 - Annex A.
- Direction of rotation: clockwise looking at the pump from the top down (marked with an arrow on the adapter and on the coupling).

SPECIFICATIONS

PUMP

The SV pump is a non-self priming vertical multistage pump coupled to a standard motor.

The liquid end, located between the upper cover and the pump casing, is held in place by tie rods. The pump casing is available with different configurations and connection types.

- Delivery: up to **144 m³/h**.
- Head: up to **280 m**.
- Temperature of pumped liquid:
 - 30°C to +120°C for SV 2, 4, 8, 16, standard version.
 - 30°C to +120°C for SV 33, 46, 66, 92, standard version.
- Maximum operating **pressure**:
 - SV 2, 4, 8 with oval flanges: 16 bar (PN 16).
 - SV 2, 4, 8, 16 with round flanges or Victaulic®: 25 bar (PN 25).
 - SV 2, 4, 8, 16 with Clamp connections: 16 or 25 bar (PN 16 or PN 25) depending on the number of stages.
 - SV 33, 46: 16, 25, 40 bar (PN 16, PN 25 or PN 40).
 - SV 66, 92: 16, 25 bar (PN 16, PN 25).

MOTOR

- Squirrel cage in short circuit, aluminium casing, enclosed construction with external ventilation.
- Standard supply Lowara motors up to 15 kW (included) for the 4-pole version, and up to 22 kW (included) for the 2-pole version. Other motor brands for higher powers.
- **The Lowara PLM surface motors have efficiency values that fall within the range normally referred to as efficiency class 1.**
 - IP55 protection.
 - Class F insulation.
 - Performances according to EN 60034-1.
 - Standard voltage:
 - Single-phase version: 220-230 V, 60 Hz.
 - Three-phase version, 2 pole: 220 V Δ, 380 V Y, 60 Hz up to 45 kW.
 - Three-phase version, 4 pole: 220 V Δ, 380 V Y, 60 Hz up to 15 kW.

MATERIALS

- **Materials in contact are suitable for use with potable water (WRAS certified).**

LIQUID END MADE ENTIRELY OF STAINLESS STEEL IN THE 2-4-8-16 m³/h STANDARD VERSION

STANDARD MECHANICAL SEAL CAN BE REPLACED WITHOUT REMOVING THE MOTOR FROM THE PUMP (FOR SV33, 46, 66, 92)

STANDARD MOTOR

CAN BE USED WITH THE HYDROVAR® CONTROL SYSTEM IN ORDER TO MANAGE THE OPERATION OF THE PUMP BASED ON THE SYSTEM CONDITIONS AND SAVE ENERGY

CHARACTERISTICS OF SV 2, 4, 8, 16 SERIES

- Vertical multistage centrifugal pump. All metal parts in contact with the pumped liquid are made of stainless steel.
- The following versions are available:
 - F: round flanges, in-line delivery and suction ports, AISI 304.
 - T: oval flanges, in-line delivery and suction ports, AISI 304.
 - R: round flanges, delivery port above the suction port, with four adjustable positions, AISI 304.
 - N: round flanges, in-line delivery and suction ports, AISI 316.
 - V: Victaulic® couplings, in-line delivery and suction ports, AISI 316.
 - N: Clamp couplings, in-line delivery and suction ports, AISI 316.
- Reduced axial thrusts enable the use of **standard motors** that are easily found in the market. **The Lowara PLM surface motors have efficiency value that fall within the range normally referred to as efficiency class 1.**
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- Mechanical seal according to EN 12756 (ex DIN 24960) and ISO 3069.
- Versions with round flanges that can be coupled to counter-flanges, according to EN 1092.
- Threaded, round or oval counter-flanges made of zinc-plated steel are standard supply for the F, T and R versions.
- Round counter-flanges made of stainless steel are standard supply for the N version.
- Easy maintenance. No special tools required for assembly or disassembly.
- **Materials are suitable for handling potable water (WRAS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.

CHARACTERISTICS OF SV33, 46, 66, 92 SERIES

- Vertical multistage centrifugal pump with impellers, diffusers and outer sleeve made entirely of stainless steel, and with pump casing and motor adaptor made of cast iron in the standard version.
- N version made entirely of AISI 316 stainless steel.
- High heads and capacities **four sizes: SV 33, 46, 66 and 92 (replacing the previous models SV 30 and 60).**
- Re-designed liquid end provides improved efficiency and energy savings.
- Innovative axial load compensation system on pumps with higher head. This ensures reduced axial thrusts and enable the use of **standard motors** that are easily found in the market. **The Lowara PLM surface motors have efficiency value that fall within the range normally referred to as efficiency class 1.**
- **Balanced mechanical seal** according to EN 12756 (ex DIN 24960) and ISO 3069, which **can be replaced without removing the motor from the pump.**
- Seal housing chamber designed to prevent the accumulation of air in the critical area next to the mechanical seal.
- **Materials are suitable for handling potable water (WRAS certified).**
- Standard version for temperatures ranging from -30°C to +120°C.
- Pump body fitted with couplings for installing pressure gauges on both suction and delivery flanges.
- In-line ports with round flanges that can be coupled to counter-flanges, in compliance with EN 1092.
- Mechanical sturdiness and easy maintenance. No special tools required for assembly or disassembly.

OPTIONAL FEATURES

- Horizontal version.
- Special voltages, 50 Hz frequency.
- Special materials for the mechanical seal, gaskets and elastomers.
- "DPS" sets consisting of two "SV" electric pumps made of AISI 316, connected in series to obtain a total head equal to the sum of the single heads of the two electric pumps.
- Tropicalized motors.
- SVH version with Hydrovar® control system.
- Eff. 1 motors.
- ATEX 94/9/CE, Group II, Category 3, Gas Group (G).

VERSION DIAGRAM

TYPICAL APPLICATIONS OF SV SERIES ELECTRIC PUMPS
WATER SUPPLY AND PRESSURE BOOSTING

- Pressure boosting in building, hotel, residential complexes.
- Pressure booster stations, supply of water networks.
- Booster packages.

WATER TREATMENT

- Ultrafiltration systems.
- Reverse osmosis systems.
- Water softeners and de-mineralization.
- Distillation systems.
- Filtration.

LIGHT INDUSTRY

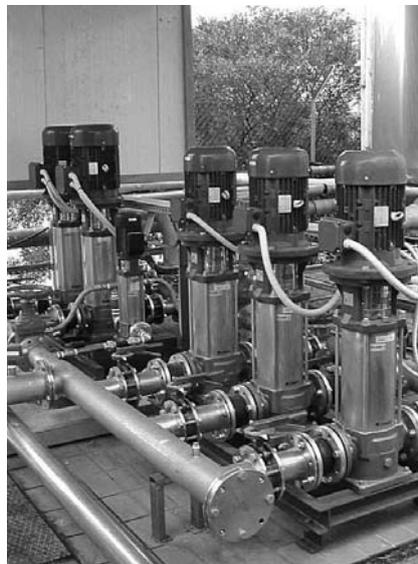

- Washing and cleaning plants (washing and degreasing of mechanical parts, car and truck wash tunnels, washing of electronic industry circuits).
- Commercial washers.
- Firefighting system pumps.

IRRIGATION AND AGRICULTURE

- Greenhouses.
- Humidifiers.
- Sprinkler irrigation.

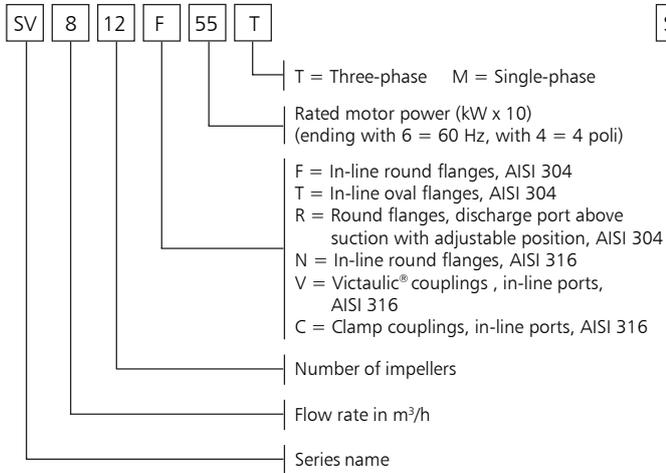

HEATING, VENTILATION AND AIR CONDITIONING (HVAC)

- Cooling towers and systems.
- Temperature control systems.
- Refrigerators.
- Induction heating.
- Heat exchangers.
- Boilers.
- Water recirculation and heating.

PRESSURE/TEMPERATURE APPLICATION LIMITS FOR COMPLETE PUMP (APPLICABLE WITH ANY OF THE SEALS LISTED ABOVE)

MOTORS

- Standard Lowara motors with powers up to 15 kW (included) for the 4-pole version, and up to 22 kW (included) for the 2-pole version. Other motor brands are used for higher powers.
- The normalized Lowara PLM motors have efficiency values that fall within the range normally referred to as **efficiency class 1**.
- Short-circuit squirrel-cage motor (TEFC), enclosed construction with external ventilation.
- IP55 protection.
- Class F insulation.
- Performance according to EN 60034-1.
- Standard voltage.
- Cable gland with standard passage dimensions according to EN 50262 (metric thread).
 - **Single-phase** version: 220-230 V 60 Hz

with built-in automatic reset overload protection up to 1,5 kW.

For higher powers the protection must be provided by the user.

- **Three-phase** version 2 pole:
220 V Δ , 380 V Y, 60 Hz up to 45 kW.

- **Three-phase** version 4 pole:
220 V Δ , 380 V Y, 60 Hz up to 15 kW.

Overload protection to be provided by the user.

- **Type of motor used:**

- **2-Pole**

Single-phase: Lowara SM (up to 1,5 kW).
Lowara PLM (above 1,5 kW).

Three-phase: Lowara SM (up to 2,2 kW).
Lowara PLM (above 2,2 kW).

- **4-Pole**

Three-phase: Lowara SM (up to 0,75 kW).
Lowara PLM (above 0,75 kW).

MOTOR NOISE

The tables show the mean sound pressure (Lp) measured as per Curve A (Standard ISO 1680).
Noise values were measured with the 60 Hz motor running idle with a tolerance of 3 dB (A).

SVH SERIES ELECTRIC PUMPS WITH HYDROVAR® CONTROL SYSTEM

The Lowara SV electric pumps are available in the SVH version, i.e. coupled to Hydrovar®, the microprocessor based control unit designed to manage the performance of the pump based on the conditions and requirements of the system. The basic SV electric pump is thus transformed into a complete pumping system suitable for a number of applications, including:

- Variable speed pressure boosting (constant pressure is maintained in industrial, civil and agricultural applications).
- Water filtration and treatment (constant flow is maintained based on flow resistance).
- Air conditioning and heating (constant differential pressure is maintained in a closed circuit).

- **No special pumps or motors:**
HYDROVAR® is mounted directly onto a standard three-phase TEFC motor with class F insulation up to 22 kW power. A wall-mounted version is available for higher powers, up to 45 kW.

- **No separate pressure sensors:**
HYDROVAR® is equipped with a pressure transmitter or differential pressure transmitter, depending on the applications.

- **No separate microprocessors:**
In multiple-pump systems the microprocessor regulates the sequential operation of the pumps or motors. Since HYDROVAR® features a built-in microprocessor, no other control devices are required.

- **No separate control panels or converters:**
HYDROVAR® performs all the functions of a pump control panel, incorporating protections against overload, short circuit, high temperature, etc. The only external device required is a fuse on the power supply line. Will depend upon any local electrical installation regulations.

- **No by-pass lines or safety systems:**
With HYDROVAR® the pump switches off immediately when demand is zero or exceeds the maximum capacity of the pump. This way there is no need to install additional safety devices.

- **No large diaphragm tanks are required:**
Without a supply tank, a constant speed pump running at maximum power will be constantly switching on and off in order to satisfy system demands. With

the HYDROVAR® system the speed of each pump varies in order to maintain a constant pressure or flow. A small surge tank is sufficient to maintain system pressure at zero demand, therefore there is no need to install a large tank. Where local regulations allow it, the HYDROVAR® systems can be connected directly to the water supply line, so there is no need to install large storage tanks on the suction side.

The pump's operation at the correct speed based on system requirements enables energy consumption to be substantially reduced.

- **Anti-condensation heater**

All the units are equipped with anti-condensation heaters that switch on when the pump is in standby mode.

OPERATING PRINCIPLE

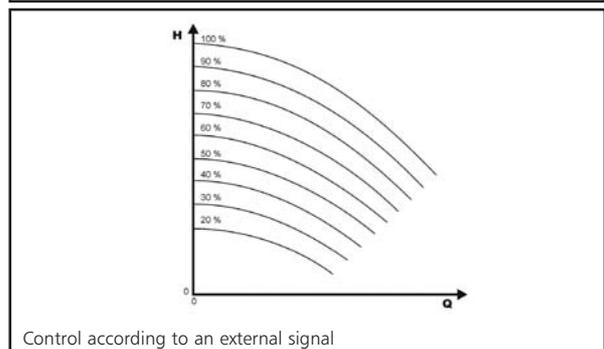

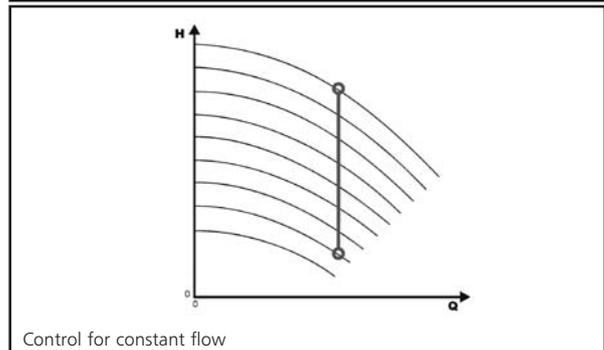

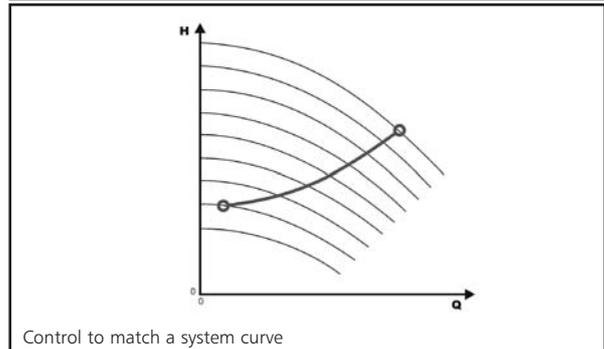

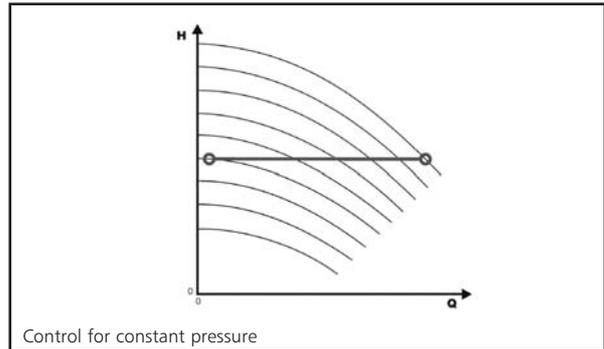

The basic function of the HYDROVAR® device is to control the pump to meet the system demands.

HYDROVAR® performs these functions by:

- 1) Measuring the system pressure or flow via a transmitter mounted on the pump's delivery side.
- 2) Calculating the motor speed to maintain the correct flow or pressure.
- 3) Sending out a signal to the pump to start the motor, increase speed, decrease speed or stop.
- 4) In the case of multiple pump installations, HYDROVAR® will automatically provide for the cyclic changeover of the pumps' starting sequence

In addition to these basic functions, HYDROVAR® can do things only by the most advanced computerised control systems, such as:

- Stop the pump(s) at zero demand.
- Stop the pump(s) in case of water failure on the suction side (protection against dry running).
- Stop the pump if the required delivery exceeds the pump's capacity (protection against cavitation caused by excessive demand), or automatically switch on the next pump in a multiple series.
- Protect the pump and motor from overvoltage, undervoltage, overload and earth fault.
- Vary the pump speed acceleration and deceleration time.
- Compensate for increased flow resistance at high flow rates.
- Conduct automatic test starts at set intervals.
- Monitor the converter and motor operating hours.
- Display all functions on an LCD in different languages (Italian, English, French, German, Spanish, Portuguese, Dutch).
- Send a signal to a remote control system which is proportional to the pressure and frequency.
- Communicate with another HYDROVAR or control system via an RS 485 interface.

TYPICAL EXAMPLE OF ENERGY SAVINGS

System: SV1608F75T vertical multistage electric pump with 7.5 kW motor equipped with Hydrovar, 80 m head. 12 hour/day operation.

Application: maintaining a constant pressure as the flow rate varies.

ROUND COUNTERFLANGES

Standard supply (included with the pump).

- SV2, 4, 8, 16 versions F, R : threaded, galvanized steel.

- SV2, 4, 8, 16 versions N : threaded, AISI 316L stainless steel.

On request :

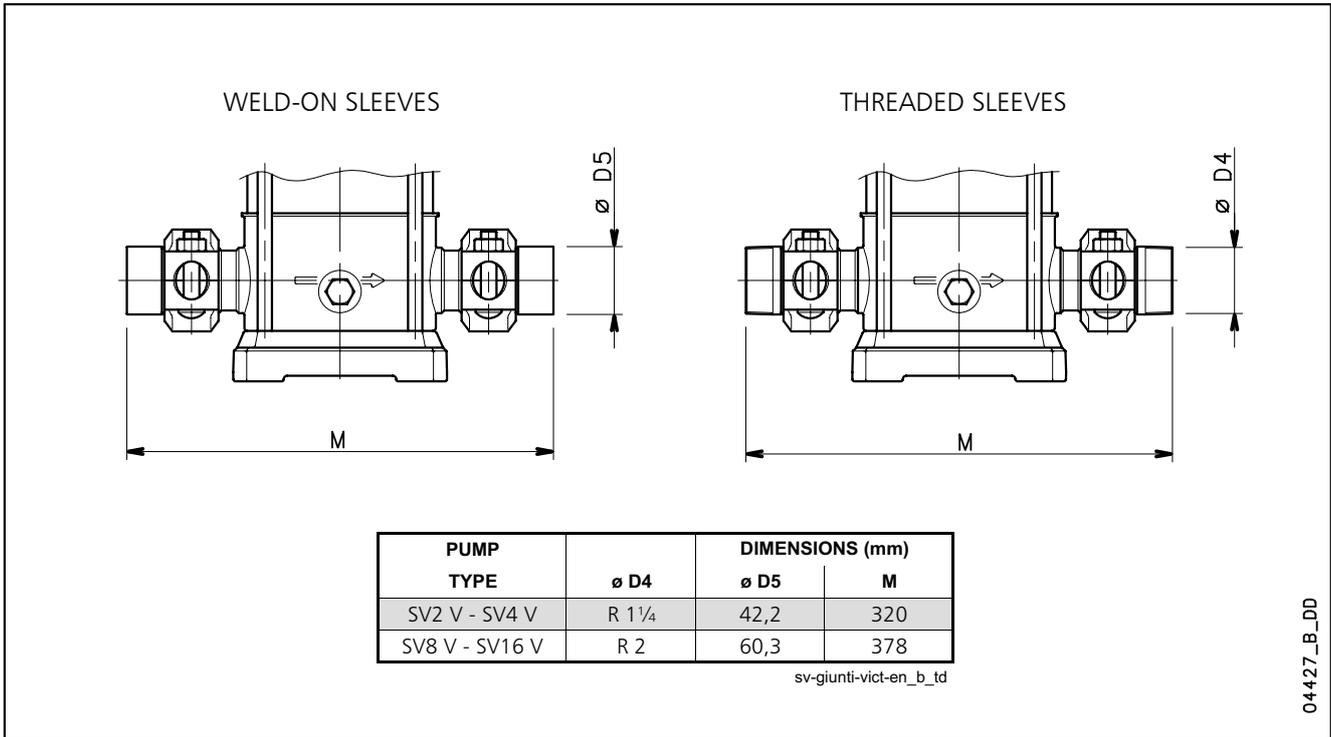

- SV2, 4, 8, 16 versions F, R : Kit containing 2 threaded counterflanges made of AISI 316L stainless steel, plus bolts and gaskets.

- SV33, 46, 66, 92 versions F : Kit containing weld-on counterflanges (PN16, PN25, PN40) or threaded ones PN16 made of galvanized steel. Each kit contains 2 counterflanges plus bolts and gaskets.

- SV33, 46, 66, 92 versions N : Kit containing weld-on counterflanges (PN16, PN25, PN40) or threaded ones PN16 made of AISI 316L stainless steel. Each kit contains 2 counterflanges plus bolts and gaskets.

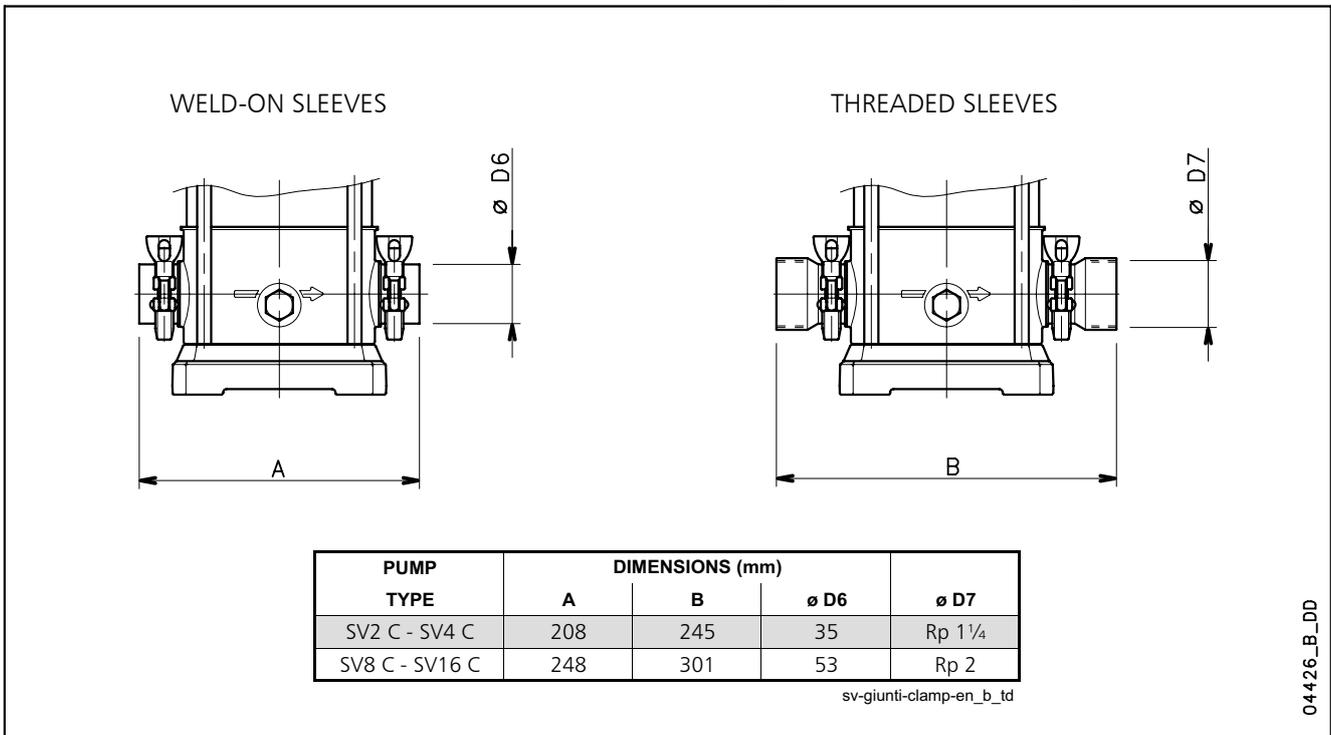

DIMENSIONS OF VICTAULIC® COUPLINGS (SV VERSION V)

VICTAULIC® ACCESSORIES (ON REQUEST)

- SV2, 4, 8, 16 version V : Kit containing 1 Victaulic® coupling with AISI 316L stainless steel weld-on or threaded sleeve, plus EPDM or FPM gasket.

DIMENSIONS OF CLAMP COUPLINGS (SV VERSION C)

CLAMP ACCESSORIES (ON REQUEST)

- SV2, 4, 8, 16 version C : Kit containing 2 Clamp coupling with AISI 316L stainless steel weld-on or threaded sleeve, plus EPDM or FPM gasket.
Coupling shape and dimensions according to DIN 32676.

NPSH

The minimum operating values that can be reached at the pump suction end are limited by the onset of cavitation.

Cavitation is the formation of vapour-filled cavities within liquids where the pressure is locally reduced to a critical value, or where the local pressure is equal to, or just below the vapour pressure of the liquid.

The vapour-filled cavities flow with the current and when they reach a higher pressure area the vapour contained in the cavities condenses. The cavities collide, generating pressure waves that are transmitted to the walls. These, being subjected to stress cycles, gradually become deformed and yield due to fatigue. This phenomenon, characterized by a metallic noise produced by the hammering on the pipe walls, is called incipient cavitation.

The damage caused by cavitation may be magnified by electrochemical corrosion and a local rise in temperature due to the plastic deformation of the walls. The materials that offer the highest resistance to heat and corrosion are alloy steels, especially austenitic steel. The conditions that trigger cavitation may be assessed by calculating the total net suction head, referred to in technical literature with the acronym NPSH (Net Positive Suction Head).

The NPSH represents the total energy (expressed in m.) of the liquid measured at suction under conditions of incipient cavitation, excluding the vapour pressure (expressed in m.) that the liquid has at the pump inlet.

To find the static height h_z at which to install the machine under safe conditions, the following formula must be verified:

$$h_p + h_z \geq (NPSH_r + 0.5) + h_f + h_{pv} \text{ ①}$$

where:

- h_p** is the absolute pressure applied to the free liquid surface in the suction tank, expressed in m. of liquid; h_p is the quotient between the barometric pressure and the specific weight of the liquid.
- h_z** is the suction lift between the pump axis and the free liquid surface in the suction tank, expressed in m.; h_z is negative when the liquid level is lower than the pump axis.
- h_f** is the flow resistance in the suction line and its accessories, such as: fittings, foot valve, gate valve, elbows, etc.
- h_{pv}** is the vapour pressure of the liquid at the operating temperature, expressed in m. of liquid. h_{pv} is the quotient between the P_v vapour pressure and the liquid's specific weight.
- 0.5** is the safety factor.

The maximum possible suction head for installation depends on the value of the atmospheric pressure (i.e. the elevation above sea level at which the pump is installed) and the temperature of the liquid.

To help the user, with reference to water temperature (4°C) and to the elevation above sea level, the following tables show the drop in hydraulic pressure head in relation to the elevation above sea level, and the suction loss in relation to temperature.

Water temperature (°C)	20	40	60	80	90	110	120
Suction loss (m)	0,2	0,7	2,0	5,0	7,4	15,4	21,5

Elevation above sea level (m)	500	1000	1500	2000	2500	3000
Suction loss (m)	0,55	1,1	1,65	2,2	2,75	3,3

Flow resistance is shown in the tables at pages 65-66 of this catalogue. To reduce it to a minimum, especially in cases of high suction head (over 4-5 m.) or within the operating limits with high flow rates, we recommend using a suction line having a larger diameter than that of the pump's suction port. It is always a good idea to position the pump as close as possible to the liquid to be pumped.

Make the following calculation:

Liquid: water at ~ 15°C $\gamma = 1 \text{ kg/dm}^3$
 Flow rate required: 30 m³/h
 Head for required delivery: 43 m.
 Suction lift: 3.5 m.
 The selection is an FHE 40-200/75 pump whose NPSH required value is, at 30 m³/h, 2.5 m.

For water at 15°C the h_{pv} term is $\frac{P_v}{\gamma} = 0,174 \text{ m (0.01701 bar)}$

and $h_p = \frac{P_a}{\gamma} = 10,33 \text{ m}$

The H_f flow resistance in the suction line with foot valves is ~1.2 m.
 By substituting the parameters in formula ① with the numeric values above, we have:

$$10.33 + (-3.5) \geq (2.5 + 0.5) + 1.2 + 0.17$$

from which we have: 6.8 > 4.4

The relation is therefore verified.

FLOW RESISTANCE
TABLE OF FLOW RESISTANCE IN BENDS, VALVES AND GATES

The flow resistance is calculated using the equivalent pipeline length method according to the table below:

ACCESSORY TYPE	DN											
	25	32	40	50	65	80	100	125	150	200	250	300
	Equivalent pipeline length (m)											
45° bend	0,2	0,2	0,4	0,4	0,6	0,6	0,9	1,1	1,5	1,9	2,4	2,8
90° bend	0,4	0,6	0,9	1,1	1,3	1,5	2,1	2,6	3,0	3,9	4,7	5,8
90° smooth bend	0,4	0,4	0,4	0,6	0,9	1,1	1,3	1,7	1,9	2,8	3,4	3,9
Union tee or cross	1,1	1,3	1,7	2,1	2,6	3,2	4,3	5,3	6,4	7,5	10,7	12,8
Gate	-	-	-	0,2	0,2	0,2	0,4	0,4	0,6	0,9	1,1	1,3
Non return valve	1,1	1,5	1,9	2,4	3,0	3,4	4,7	5,9	7,4	9,6	11,8	13,9

G-a-pcv_a_th

The table is valid for the Hazen Williams coefficient $C = 100$ (cast iron pipework). For steel pipework, multiply the values by 1.41. For stainless steel, copper and coated cast iron pipework, multiply the values by 1.85.

When the **equivalent pipeline length** has been determined, the flow resistance is obtained from the table of flow resistance.

The values given are guideline values which are bound to vary slightly according to the model, especially for gate valves and non-return valves, for which it is a good idea to check the values supplied by the manufacturers.
