Longitudinal disconnect terminal blocks for current transformer circuits

Automatically and safely shorted

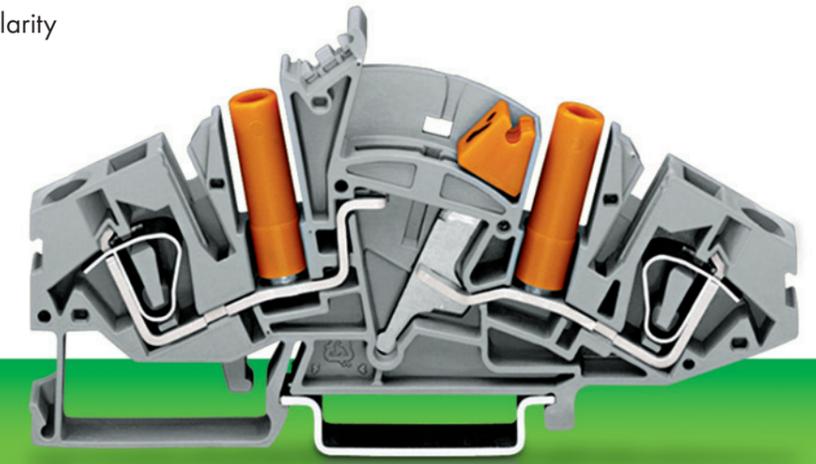

With these disconnect and test terminal blocks for current transformer circuits, the transformer secondary winding is automatically short-circuited when the screwless, pivoting disconnect link is switched over. There are no undefined intermediate positions. The terminal blocks are prepared for short-circuiting the transformer - once and for all - by the single action of plugging in a short-circuit jumper.

Longitudinal disconnect terminal blocks for current transformer circuits

Compact and economic

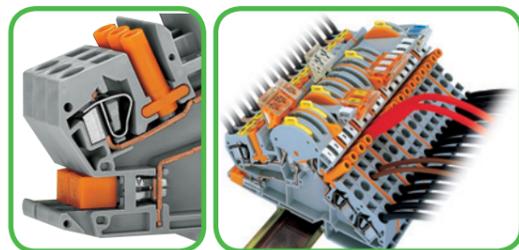

Transformer test circuits (reference measurement, transformer short-circuit and relay testing) can be implemented particularly in a cost-effective way with just two longitudinal disconnect terminal blocks - without loss of clarity and safety.

Testing fuse terminal blocks

As a general principle, all WAGO fuse terminal blocks are fitted with CAGE CLAMP® connection for single, stranded and fine-stranded conductors. Multi-conductor terminal blocks or plug-in jumper systems enable input paths to be distributed between several individual fused consumers. Through terminal blocks with the same shape create order and clarity. Receptacle terminal blocks from the WAGO X-COM-SYSTEM are provided for fitting fuse plugs, plug-in diodes and indicator modules right up to multipole interface modules.

^①The electrical data is defined by the fuse and fuse-blown indicator respectively.
